

**Remedial Action Plan for the APS Douglas
Former Manufactured Gas Plant, Douglas, Arizona
ADEQ VRP Site Code 513300-00**

Final

February 2020

Arizona Public Service Company

Voluntary Remediation Program Work Plan Checklist

Complete Shaded Areas and Submit with Work Plan

Site Name: Douglas Former APS Manufacturing Gas Plant VRP Site Code: 513300-00

Volunteer/Applicant Name: Arizona Public Service

Volunteer/Applicant Email Address and Phone: judith.heywood@aps.com, 480/250-3850

Authorized Agent (AA)/Consulting Company: Jacobs

AA/Consultant Email Address and Phone: dave.allard@jacobs.com 480/295-3913

| Reference | Summary of Statutory Requirement | Page(s) Where Addressed in Work Plan | VRP Use Only |
|------------------------------|--|---|--------------------------|
| | (please review all statutes in their entirety to ensure compliance) | (write N/A if not applicable) | |
| | | Section 1. | |
| §49-175A.1 | Summary of existing site characterization and assessment information; information regarding any remediation previously conducted; copies of referenced reports not previously submitted; | | <input type="checkbox"/> |
| | | Not applicable. | |
| §49-175A.2 | If the site has not been characterized, a plan to conduct site characterization and a schedule for completion. | | <input type="checkbox"/> |
| §49-175A.3.a | If site characterization is completed, a description of how the remediation will comply with §49-175B ("Work Plans") and how the completion of remediation will be verified. A schedule for completion must be included. | Section 5, Pages 5-1 through 5-3; Section 7.2, Pages 7-3 through 7-5; Section 7.5, Pages 7-18 through 7-21; Schedule on page 7-27). | <input type="checkbox"/> |
| §49-175A.3.b | If site characterization is completed, the work plan may provide for the remediation to be conducted in phases or tasks. A schedule for completion must be included. | Section 7.7, Page 7-27. | <input type="checkbox"/> |
| §49-175A.4 | Schedule for submission of progress reports. | Section 7.7, Page 7-27. | <input type="checkbox"/> |
| §49-175A.5 | A proposal for community involvement as prescribed by §49-176 ("Community Involvement Requirements") | Section 7.3.3, Page 7-8. | <input type="checkbox"/> |
| §49-175A.6 | If known, a list of institutional or engineering controls necessary during remediation and after completion of the proposed remediation to control exposure to contaminants. | Section 7.4.7, Pages 7-13 through 7-15. | <input type="checkbox"/> |
| §49-175A.7 | A proposal for monitoring during remediation and after the remediation if necessary to verify whether the approved remediation levels or controls have been attained and will be maintained. | Section 7.5.1 and 7.5.2, Pages 7-18 through 7-21. | <input type="checkbox"/> |
| §49-175A.8 | A list of any permits or legal requirements known to apply to the work or already performed by the applicant. | Section 7.3.2, Pages 7-5 through 7-7. | <input type="checkbox"/> |
| §49-175A.9 | If requested by the department, information regarding the financial capability of the applicant to conduct the work identified in the application. (IF APPLICABLE) | Section 7.1, Page 7-2. | <input type="checkbox"/> |

| Site Name: | Douglas Former APS Manufacturing Gas Plant | | VRP Site Code: | 513300-00 | |
|----------------------------|--|---|--------------------------|-----------|--|
| Reference | Summary of Statutory Requirement | Page(s) Where Addressed in Work Plan | VRP Use Only | | |
| | (please review all statutes in their entirety to ensure compliance) | (write N/A if not applicable) | | | |
| §49-175B | Remediation levels or controls for remediation conducted pursuant to this article shall be established in accordance with rules adopted pursuant to §49-282.06 unless one or more of the following applies: see §49-175B.1 through §49-175B.4, below. | Section 7.2, Pages 7-3 through 7-5. | <input type="checkbox"/> | | |
| §49-175B.1 | The applicant demonstrates that remediation levels, institutional controls, or engineering controls for remediation of contaminated soil comply with §49-152 and the rules adopted. | Section 7.2, Pages 7-3 through 7-5. | <input type="checkbox"/> | | |
| §49-175B.2 | The applicant demonstrates that remediation levels, institutional controls, or engineering controls for remediation of landfills or other facilities that contain materials that are not subject to §49-152 (i.e.: asbestos) do not exceed a cumulative excess lifetime cancer risk between 1×10^{-4} to 1×10^{-6} , and a hazard index of no greater than 1. | Section 7.2, Pages 7-3 through 7-5. | <input type="checkbox"/> | | |
| §49-175B.3 | The applicant demonstrates that on achieving remediation levels or controls for a source or potential source of contamination to a navigable water, the source of contamination will not cause or contribute to an exceedance of surface water quality standards, or if a permit is required pursuant to 33 United States Code §1342 for any discharge from the source, that any discharges from the source will comply with the permit. | Not applicable. | <input type="checkbox"/> | | |
| §49-175B.4 | The applicant demonstrates that, on achieving remediation levels or controls for a source of contamination to an aquifer, the source will not cause or contribute to an exceedance of aquifer water quality standards (AWQS) beyond the boundary of the facility where the source is located. | Section 5, Pages 5-1 through 5-3; Section 7.2.3.1, Pages 7-3 and 7-4. | <input type="checkbox"/> | | |
| §49-175C | The VRP may waive any work plan requirement under this section that it determines to be unnecessary to make any of the determinations required under §49-177 . If any waivers are requested in the Work Plan or have been previously requested and approved by the VRP, cite them in the Work Plan, including a citation of the statute for which the waiver applies. | Not applicable. | <input type="checkbox"/> | | |

Voluntary Remediation Program Work Plan Checklist

Complete Shaded Areas and Submit with Work Plan

Site Name: Douglas Former APS Manufacturing Gas Plant VRP Site Code: 513300-00

To support the prerequisites established by A.R.S. §49-177 and §49-180, the VRP expects certain documentation to accompany a Work Plan. The following provides a list of attachments/exhibits which are recommended for submittal with a Work Plan to provide the information required by the statutes.

| Work Plan Information | Title of Figure/Table/Attachment/Exhibit Where Requested Information is Cited (write N/A if not applicable) | Figure/Table/ Attachment or Report Page Number (write N/A if not applicable) | VRP Use Only |
|--|--|---|--------------------------|
| Site Location Map (topographic or aerial) | Site Map | Figure 1-1 | <input type="checkbox"/> |
| Site Map (to scale) | Site Plan | Figure 1-2 | <input type="checkbox"/> |
| Historical Sampling Data Table | Analytical summary tables | Tables 1-3 through 1-6, 2-3 through 2-8. | <input type="checkbox"/> |
| Historical Sample Location Map (to scale) | Previous investigations soil sampling locations and pre-design testing boring locations. | Figures 1-5 and 2-1. | <input type="checkbox"/> |
| Proposed Sample Location Map (to scale) | Not Applicable - Samples will be collected from excavated areas based on SW-846 for sample frequency. The DU areas show the general areas samples will be collected. | Figure 7-2, Section 7.5.1.2. Pages 7-20 and 7-21. | <input type="checkbox"/> |
| Sampling and Analysis Plan (includes Field Sampling Plan & Quality Assurance Plan) | Section 7.4 and 7.5 | Pages 7-9 through 7-26 | <input type="checkbox"/> |
| Proposed Remediation System Location Map | Proposed Excavation Plan | Figure 7-1 | <input type="checkbox"/> |
| Proposed Remediation System Layout (Design Drawings) | Proposed Excavation Plan | Figure 7-1 | <input type="checkbox"/> |
| Schedule for Implementation of Project Activities* (Gantt Style Chart) | Section 7.7 | Page 7-27 | <input type="checkbox"/> |
| *Project Activities are defined in A.R.S. §§49-175A.2 through 49-175A.4, and 49-176A.2 (Community Involvement). | | | |
| Proposed Language for Public Notification of Remediation (i.e.: example signage) | Section 7.3.3 (English/Spanish, newspaper, site signage, meetings, site status news letters with construction updates). | Page 7-8 | <input type="checkbox"/> |
| Plan for Investigative Derived Waste (IDW) | Section 7.3.2, Special and Hazardous Waste Requirements, and Section 7.4.8 Soil Segregating. | Page 7-6 and 7-7, 7-15 through 7-18. | <input type="checkbox"/> |
| Evaluation of Remedial Alternatives (i.e.: for Feasibility Study Work Plan) | Section 6 | Pages 6-1 through 6-6 | <input type="checkbox"/> |
| <p>DOES THE WORK PLAN PROPOSE IMPLEMENTING SITE-SPECIFIC REMEDIATION LEVELS?</p> <p>Yes <input type="checkbox"/> No <input checked="" type="checkbox"/></p> | | | |
| <p>DOES THE WORK PLAN PROPOSE EVALUATION OF BACKGROUND LEVELS?</p> <p>Yes <input checked="" type="checkbox"/> No <input type="checkbox"/></p> <p>A lead and arsenic evaluation was proposed in the approved Site Investigation Work Plan with results included in the Remedial Action Plan, Section 5.</p> | | | |

NOTE: When reports are submitted which document any type of sampling activity, the submittal of Electronic Data per ADEQ's [Groundwater Data Submittal Guidance \(V3.4\)](#) is strongly recommended.

1. Introduction

The Arizona Public Service Company (APS) is proposing to conduct remediation activities at the former manufactured gas plant (MGP) site (the Site) in the City of Douglas (the City), Arizona. This remedial action plan (RAP) for the Site provides a summary of the Site history and previous investigations at the Site (Jacobs, 2019a); presents the results of a human health risk assessment, groundwater modeling, and metals evaluation for the Site; discusses the remedial action objectives (RAOs) and remediation technology screening results; and describes the recommended remedial action activities for the Site. APS is conducting the remediation activities under the Arizona Department of Environmental Quality's (ADEQ's) Voluntary Remediation Program (VRP). The VRP site code for the Site is 513300-00.

The Site is located near the southwest corner of East 3rd Street and Pan American Avenue in Cochise County, Section 13, Township 24 South, Range 27 East, Douglas, Arizona U.S. Geological Survey 7.5-Minute Topographic Quadrangle (**Figure 1-1**). The Site is approximately 200 yards north of the international border between the United States and Mexico and west of the Douglas Arizona Port of Entry located at Pan American Avenue.

The properties adjacent to the western Site boundary are owned by El Paso Natural Gas and a private landowner. Property adjacent to the northern, eastern, and southern Site boundaries are owned by private landowners and the City. The area to the north of the Site is characterized by trees and a wash. The area to the east of the Site contains a walkway from the United States-Mexico border to East 3rd Street. This walkway is used by approximately 3,000 pedestrians per day. The area to the south of the Site is undeveloped land primarily used by the U.S. Border Patrol for border security. The area to the west of the Site is largely undeveloped except for an El Paso Natural Gas metering and compressor station and buried Southwest Gas natural gas utility lines that leave the compressor station and run generally east and north from the station.

The Site was formerly owned by Arizona Edison Company Gas Works, APS's predecessor company (EDR, 2018). The MGP was located at the Site from approximately 1905 through 1947 and operated until at least the early 1930s, when MGP operations were terminated. The Douglas Gas Corporation originally owned and operated the MGP until 1925. During the 1930s, Arizona Edison Company converted the plant to natural gas, purchasing natural gas from the El Paso Natural Gas Company for distribution in the City. Arizona Edison Company provided natural gas to the City until the 1950s, after which APS provided natural gas to the City.

APS sold the Site to a private landowner in 1966. The City acquired the property in 1987. The Site property is crossed by an El Paso Natural Gas easement and Southwest Gas natural gas pipeline. The City currently does not use the property; however, construction debris consisting of soil, gravel, asphalt, and concrete has been dumped on the property by outside entities without approval by the City. Prior to the 2019 site investigation activities, the City removed the construction debris from the Site.

A map based on historical documents (Arcadis/Geraghty & Miller, 1998; Geraghty and Miller, 1996a, 1996b) is presented on **Figure 1-2**. The map shows the Site layout, including the removed and remaining concrete pads and foundations associated with former MGP operations. The approximate locations of the structures and other features associated with the former MGP were identified based on Sanborn fire insurance maps and previous site investigation reports. The property parcels in relation to former MGP operations, based on the historical reports, are shown on **Figure 1-3**.

Based on the findings of previous investigations (1996–1998) and data from the 2019 pre-design testing investigation (Section 2), former MGP operations have impacted surface and subsurface soils at the site, and compounds potentially related to the former MGP operations and existing subsurface features remain. As a result, the Site requires additional remedial activities, including removal of subsurface features related to former MGP processes and the impacted soil.

1.1 Site Description

The geology and hydrogeology of the Site are described in this section.

1.1.1 Geology

The Site is situated in the Douglas Basin of southeastern Arizona at an elevation of approximately 3,950 feet above mean sea level and lies within the Basin and Range Province in the Sulphur Springs valley. Soils from the ground surface to 5 feet below ground surface (bgs) are generally classified as coarse grained with gravels, gravels with fines, and clayey gravel (EDR, 2018). Based on the 1996 site investigation, soils were classified from the center of the Site (soil boring SB-4 shown on **Figure 1-4**) as silt and sand from ground surface to 3 feet bgs; clay with silt and sand from 3 to 7.5 feet bgs; a mix of clayey silt, silt, sand, and clay from 7.5 to 15 feet bgs; and medium coarse sand from 15 to 16.5 feet bgs (Geraghty and Miller, 1996a). The 2019 pre-design testing investigation soil descriptions are generally consistent with the 1996 site investigation.

1.1.2 Hydrogeology

In 1990, groundwater levels within a 2-mile radius of the Site ranged from 46 to 284 feet bgs (Rascona, 1993). Small perched water zones occur locally in the upper alluvial deposits and likely account for the large variation of water levels. According to the Arizona Department of Water Resources, groundwater below the Site may be perched and was likely to be encountered at a depth of approximately 50 feet, with the direction of groundwater flow below the Site unknown because of limited data (Rascona, 1993). Groundwater wells during the pre-design testing investigation indicated water levels of approximately 27 feet bgs at the Site, with the groundwater gradient oriented in a westerly direction based on 2019 survey data.

1.2 Surrounding Environmental Issues

1.2.1 Local Smelting Operations

The Calumet & Arizona Company and Phelps-Dodge Corporation Reduction Works operated two copper smelters approximately 1 mile west of the Site from 1904 to 1931 and 1931 to 1987, respectively (ATSDR, 1995). During the smelting process, metal ores were heated, producing molten metals and releasing sulfur dioxide and particulate matter through two 600-foot stacks. Between 1970 and 1987, ADEQ and EPA periodically monitored offsite ambient air for concentrations of hazardous substances. Prevailing winds generally blew toward the south and north-northeast. The smelter had a history of stack emission rates for particulate matter and sulfur dioxide gas exceeding U.S. Environmental Protection Agency (EPA) National Ambient Air Quality Standards (NAAQS), which led to closure of the smelter in 1987.

In 1985 the Arizona Department of Health Services (ADHS) collected 52 surface samples offsite of the reduction works property from a widespread area in the City to evaluate background lead concentrations in the area. Lead concentrations in the samples ranged from 50 to 1,170 milligrams per kilogram (mg/kg), with an average lead concentration of 254 mg/kg. The Agency for Toxic Substances and Disease Registry (ATSDR) also reported offsite maximum and mean background arsenic concentrations of 35.8 and 15 mg/kg, respectively, for surface samples collected between 1 and 6 miles of the smelter site all of which exceed the residential SRL.

1.2.2 EDR Search

Environmental Data Resources, Inc. (EDR) completed a search of available environmental databases for the Site and the surrounding area. The executive summary for the EDR report (EDR, 2018), including a listing of databases searched, is presented in **Appendix A**.

The Site was identified on the EDR proprietary database for former MGP sites. No other listings for the Site were included in the EDR report. EDR identified 13 additional findings within 1/4 mile of the Site. The findings were included on the following environmental database lists:

- **AST**—Aboveground Storage Tank (AST) Listing
- **AUL**—Activity and Use Limitations list, also known as Declaration of Environmental Use Restriction (DEUR)
- **AZURITE**—ADEQ-maintained repository of sites remediated under ADEQ programs
- **ECHO**—Enforcement and Compliance History Information
- **EMAP**—All Places of Interest Listing
- **FINDS**—Facility Index System/Facility Registry System
- **LUST**—Leaking Underground Storage Tank (LUST) Listing
- **MANIFEST**—Hazardous waste manifest information
- **RCRA-CESQG**—Resource Conservation and Recovery Act of 1976 (RCRA) Conditionally Exempt Small Quantity Generator (CESQG)
- **UST**—Underground Storage Tank (UST) Listing
- **VCP**—Voluntary Cleanup Priorities (VCP) Listing (i.e., voluntary remediation sites)

Seven of the findings were located within 1/8 mile of the Site, with four of the associated facilities having reported releases and/or violations. The companies and/or generators associated with the listings are presented in Sections 1.2.3 and 1.2.4, along with a summary of the key findings.

1.2.3 Releases or Enforcement Actions

- **Border Express**, 305 Pan American Avenue – LUST, UST, EMAP, Enforcement

Border Express is a commercial fueling station approximately 0.1 mile northeast (upgradient) of the Site. The station had an 18,000-gallon single-walled fiberglass UST installed in 2000 and reported as a LUST in 2012. The UST was removed, the soil was remediated to Tier 1 standards, and the incident was closed by ADEQ in 2013.

- **Douglas Port of Entry**, 1 Pan American Avenue – VCP

Douglas Port of Entry is the Border Port of Entry for Mexico, located approximately 0.1 mile southeast (upgradient) of the Site. The facility was included on the VCP list for potential groundwater contamination from a former heating oil UST. No further action status for groundwater was issued by ADEQ in 2007 based on benzene, toluene, ethylbenzene, and xylenes (BTEX) and total petroleum hydrocarbon (TPH)-diesel concentrations in the groundwater meeting required remediation levels.

- **U.S. Department Homeland Security Border Station**, 5 N. Pan American Avenue – UST

The Border Station is located approximately 0.1 mile southeast (upgradient) of the Site. A UST was installed in 1934 and removed in 1990. No impacts to groundwater or other releases were reported.

- **Border Mart Shell, 100 E. 3rd Street** – UST, EMAP, Enforcement, Financial Assurance

Border Mart Shell is a commercial fueling station approximately 0.1 mile northeast (upgradient) of the Site. The facility has two double-walled 12,000-gallon petroleum USTs installed in 1997. The facility received enforcement notices for violations in 2008 and 2013; the EDR listed the enforcement notice type as 'not recorded' and the notices have been closed. No environmental releases have been reported.

- **Douglas Chevron**, 46 N. Pan American Avenue – UST, EMAP, Enforcement, Financial Assurance

Douglas Chevron is a commercial fueling station on the corner of U.S. Highway 191 and 5th Street, approximately 0.2 mile northeast (hydrologically upgradient) of the Site. The station has two 15,000-gallon USTs, which were installed in 2004 to store gasoline and diesel. The facility had reported violations in 2006, 2008, 2013 and 2016. All cases were closed and further investigation was not reported.

1.2.4 Other Environmental Database Findings

- **White Knight Healthcare, Inc.**, 300 S. 1st Street – RCRA-CESQG, FINDS, ECHO

White Knight Healthcare is a commercial disposable healthcare equipment manufacturing company located approximately 0.2 mile east of the Site (upgradient). It was identified as a CESQG. No violations or releases have been reported.

- **Hamlin, Inc.**, 230 International Ave. – RCRA Nongen, FINDS, ECHO

Hamlin Inc. is located 0.2 mile east-southeast of the Site and registered with the FINDS database in 1990 and is a RCRA non-generator. No violations or release were reported.

- **Walmart**, 199 West 5th Street – AST, RCRA-CESQG, EMAP, MANIFEST

Walmart is located approximately 0.25 mile north of the Site (hydrologically downgradient). It is a CESQG with an AST installed in 2004. No violations or releases were reported.

1.3 Douglas MGP Site History

The history of Site operations, a description of MGP processes and waste, and the environmental issues are presented in this section and summarized in **Table 1-1**. Historical information about the Site was obtained from the following documents:

- *Site Investigation, Former Manufactured Gas Plant, Douglas, Arizona* (Geraghty & Miller, 1996a)
- *Composite Soil Sampling, Former Manufactured Gas Plant, Douglas, Arizona* (Geraghty & Miller, 1996b)
- *Material Removal Activities, Former APS Manufactured Gas Plant Site, Douglas, Arizona* (Arcadis/ Geraghty & Miller, 1998)

In addition, the following Sanborn fire insurance maps and aerial photographs from the 1996 Geraghty & Miller site investigation report were reviewed. The maps and photos are presented in **Appendix B**.

- Sanborn Fire Insurance Maps – 1909, 1914, 1929, and 1947 (Geraghty & Miller, 1996a)
- Aerial Photographs – 1958, 1970, 1979, 1984, 1992, 2003, 2007, 2010, and 2017 (EDR, 2018)

1.3.1 Site Ownership and Operational History

Geraghty & Miller Inc. reviewed Sanborn fire insurance maps from 1909, 1914, 1929, and 1947 and gas production statistics from the *Brown's Directory of American Gas Companies* (Brown's Directory) for select years from 1906 through 1932 to develop an operational history of the Site (**Table 1-1**). Additional historical information was obtained from aerial photographs provided by EDR (EDR, 2018) and previous investigation reports.

The Site began operation as an MGP between 1903 and 1908 and continued until the early 1930s, primarily using oil as the feedstock. The Douglas Gas Corporation operated the MGP until 1925. Sanborn maps indicate that the MGP was operated by Arizona Edison Company, a corporate predecessor of APS, from 1925 until it ceased production around 1932. APS sold the property to a private landowner in 1966. The City acquired the property in 1987. The 1929 Sanborn map shows the relative locations of the former

MGP structures. The 1947 Sanborn map shows the Site as mostly vacant, with the former concrete storage shed, purifier, and the concrete meter house still present.

The 1958 aerial photograph in the EDR report has limited resolution; however, the former gas holders and/or concrete pads, purifier structure, and, possibly, the concrete shed are somewhat visible. The wash to the north of the Site is visible, approximately 150 feet north of the purifier structure. The large concrete purifier, small concrete shed, concrete foundations for two gas holders, a generator house, and a steel manhole cover bolted to a crude oil sump were present at the Site in 1996 (Geraghty and Miller, 1996b). Two concrete gas holder pads, two concrete small purifier pads, concrete foundations of the meter house, and a portion of the generator house foundation remained on the Site in 1996 after removal actions were complete (Arcadis/Geraghty & Miller, 1998).

The City property parcel and surrounding property parcels near the Site contained bulk construction debris piles, including soil, concrete, asphalt, and gravel. A vegetative cover can be seen over the construction debris in a 2017 aerial photograph from the EDR report.

The following list provides a summary of the Site structures and operations based on previous investigation reports (Geraghty & Miller, 1996a; Arcadis/Geraghty & Miller, 1998). The approximate locations and sizes of existing and former structures/features based on historical reports are shown on **Figure 1-2**.

- **Generator House.** The generator house was used to manufacture oil gas, with an annual production ranging from approximately 13,700,000 cubic feet (ft³) in 1910 to approximately 51,500,000 ft³ in 1930. A portion of the generator house foundation remains on the Site. Based on available Sanborn maps, the generator house foundation is approximately 4,000 square feet.
- **Oil Sump/Tank.** An oil sump, approximately 2.5 feet in diameter and 3.5 feet tall and associated with a suspected aboveground oil tank of unknown capacity, was located west of the large purifier. The oil sump/tank was removed in August 1996.
- **Gas Holders.** Two gas holders of unknown capacity were located east and southeast of the generator house. The concrete gas holder foundations/pads remain on the Site. Based on available Sanborn maps, the gas holders have a combined area of 6,000 square feet.
- **Purifiers.**
 - One large purifier structure, approximately 40 feet in diameter and 15 feet high, was located northeast of the generator house. The large concrete purifier pad was removed in August 1996.
 - Two small purifiers of unknown capacity were located east of the generator house. The two small concrete purifier pads remain on the Site. Based on available Sanborn maps, the purifiers have a combined area of 500 square feet.
- **Meter House.** A meter house of unknown size was located southeast of the generator house. The foundation of the meter house remains on the Site. Based on available Sanborn maps, the meter house foundation is approximately 400 square feet.
- **Debris Pile.** One debris pile, 250 feet long (north-south direction) by 130 feet wide, was located west of the generator house. The debris pile was removed in August 1996.
- **Storage Shed.** One small concrete storage shed, 10 feet long by 10 feet wide, was located north of the generator house. The concrete shed was removed in August 1996. The concrete foundation of the shed was not observed on the Site during the pre-design testing investigation conducted in 2019 (Jacobs, 2019a).

1.3.2 Description of MGP Processes

In the United States, the first uses of manufactured gas for lighting were reported in Philadelphia in 1796 and in Richmond, Virginia, in 1803. Manufactured gas was produced by the following three primary processes:

- Coal carbonization (coal gas)

- Carbureted water gas (CWG)
- Oil gas

Based on historical records, only the oil gas process was used at the Site (Geraghty & Miller, 1996a). However, the coal gas and CWG processes are described in this section for comparison with the oil gas process.

1.3.2.1 Coal Carbonization

The earliest MGPs used coal carbonization to produce gas. Coal gas was used exclusively from 1816 to 1875, when the CWG process was developed. Coal was used as a feedstock to produce gas in various types of retorts, with coke generated as a byproduct. Based on historical records, coal gas was not used at the Site.

1.3.2.2 Carbureted Water Gas

CWG involves the enhancement of water gas (blue gas) by spraying oil into a hot vessel that contains the water gas, thereby increasing the calorific value of the water gas. Blue gas was an abundant byproduct of the petroleum industry, which made CWG the most important manufactured gas process in the United States at the time.

The CWG process is intermittent, with alternating "blows" or blast periods and "runs" or gas-making periods. The typical CWG-generating equipment consisted of three brick-lined cylindrical steel vessels: the generator, the carburetor, and the superheater. During a blow, a producer gas that is high in carbon dioxide is formed in the generator by passing air through an incandescent mass of coke or anthracite. This gas is burned by secondary air. The hot products of combustion heat the carburetor checkbrick and then pass from the top of the superheater to the stack. During a run, water gas is made in the generator and then passed into the top of the carburetor, where the oil is sprayed. This mixture is passed down through the carburetor and up through the superheater. As the mixture passes the hot checkbrick, the mixture is thermally cracked and fixed into gases. The CWG, a mixture of blue and oil gas, is passed from the top of the superheater through a water-sealed wash box, where the gas is initially cooled and some of the heavy tars are condensed and removed.

The gas is passed through additional condensers to cool the gas to ambient temperatures. Direct contact with water cools and scrubs the gas. The gas is then sent to a relief holder, which provides constant pressure for gas outflow to the purifying systems during blows and runs. Larger plants featured tar extractors, naphthalene scrubbers, and liquid purification systems to remove the bulk of the hydrogen sulfide prior to passing the gas through the dry purification systems. After hydrogen sulfide removal at these larger plants, the gas was metered and sent to the storage holders pending distribution to the customers.

1.3.2.3 Oil Gas

The oil gas process consists of thermocracking oil in a steam atmosphere. The generating equipment is similar to that used by CWG production. The generator was replaced by a vaporizer similar to the carburetor, filled with checkbrick, and equipped with an oil spray. The carburetor was replaced by a vaporizer followed by a superheater, similar to the CWG process.

The process is cyclical and consists of blows and runs. During a blow, oil is combusted in the vaporizers, and the products of combustion heat the checkbrick of the vaporizers and superheater and pass from the top of the superheater to the stack. During a run, oil is sprayed into the vaporizer in the absence of air and in the presence of steam. As the mixture passes the hot checkbrick, it is thermally cracked and fixed into gases.

During the run, the stack valve is closed and the oil gas passes to the washbox. The remainder of the process is the same as the CWG process.

1.3.3 Description of MGP Waste

The information in this section was obtained from the historical information regarding MGP processes and previous reports.

Byproducts formed during the manufacture of oil gas were iron oxide purifier waste, light oils, tar, and lampblack. The light oils and tars were generally recovered during condensing or scrubbing operations. Each waste is described as follows:

- **Lampblack** – The formation of a large amount of lampblack was unique to the oil-gas processes. Lampblack resulted from the high temperature of the gas-making operation, and the amount of lampblack recovered depended on the manufacturing process used. In most plants, lampblack was regarded as a valuable byproduct and was the source of additional revenue or was used as fuel. Depending on the process, approximately 20 pounds of lampblack were formed for every 1,000 ft³ of gas manufactured, with the majority of the lampblack removed from the gas stream in the wash box. The water from the wash box containing this lampblack in suspension passed through large overflow pipes and was typically stored in settling ponds. Available evidence does not indicate the former presence of a lampblack settling pond. However, because the oil gas process was used at the Site, it is likely lampblack was produced. The chemical constituents of lampblack include carbon, polynuclear aromatic hydrocarbons (PAHs), and heavy metals.
- **Tar** – Tar was primarily a product of the coal carbonization processes, and to a lesser extent, the carbureted water gas processes; the oil-gas processes produced the least amount of tar and consisted of complex hydrocarbons that were removed from the gas stream immediately after generation during cooling, were condensed during gas cooling in the relief holder, or were removed during secondary purification. Areas where tar may have accumulated include the gas holders, areas along underground piping, areas adjacent to gas generators and scrubbers, and in a lampblack settling pond. Chemical constituents of tar include volatile aromatic hydrocarbons and PAHs. The tar was primarily reused as a supplement to boiler fuels, with a small fraction sold.
- **Fuel Oil** – Fuel oil was used as the primary feedstock material for the oil-gas process. Oil was sprayed into the gas-generating apparatus and cracked into lighter hydrocarbon fractions during gas production. Various grades of fuel oil were likely used throughout the Site's history, with increased use of heavy fuel oil or residual oil during peak production years. Areas where oil may be encountered include fuel oil tanks and oil storage tanks. Oil used at the Douglas property was likely stored in an aboveground steel crude oil tank at the Site (**Figure 1-2**; Geraghty & Miller, 1996a).
- **Iron Oxide Purifier Waste** – Wood chips saturated with ferric hydrate were used to remove the hydrogen sulfide from the gas during the final purification process. Some tars or lampblack may also have been removed in the purifiers. Wood chips were replaced as they became depleted or "spent." Areas that may be impacted by iron oxide purifier waste include the former purifier locations and area between the purifiers. Constituents include metals, sulfur, sulfate

1.4 Previous Site Investigations and Interim Remedial Actions

Since 1995, the following site investigations and interim remedial action (IRA) have been conducted at the Site:

- **1995 – Site Investigation.** Geraghty & Miller conducted a site investigation, with sampling events in October 1995 and December 1995, to evaluate the presence of MGP residuals at the Site. The primary purpose of the investigation was to assess the nature and extent of potential contamination resulting from past MGP activities at the Site and to assess the presence of potential pathways of contaminant migration. The site investigation was limited to surface and shallow subsurface soil sampling (up to 21 feet bgs). A total of 14 surface soil samples, 23 subsurface soil samples, and 2 duplicate samples were collected.
- **1996 – Site Investigation.** Based on 1995 investigation results, Geraghty & Miller collected five composite surface-soil samples on June 1, 1996, within a 20-foot radius of the areas where MGP impacted soil was previously identified. Each composite sample consisted of six to eight discrete locations within each sampled area. In addition, a composite of the five composite samples was

submitted to the laboratory for analysis. Based on visual observation and data from the site investigation, five areas of the Site were identified and recommended for soil removal.

- **1996 – Interim Remedial Action.** Geraghty & Miller conducted material removal and sampling activities in August 1996 to address the five areas recommended for soil removal. Based on the analytical results from the initial removal action, three additional areas were identified for soil removal.

Prior to 1997, soil data were compared to ADEQ residential and non-residential health-based guidance levels. In December 1997, Chapter 7, Article 2 of the Arizona Administrative Code (A.A.C.) was amended to establish predetermined residential and non-residential soil remediation levels (SRLs) to protect human health and the environment that were consistent with the methodology used by EPA and Region 9 EPA guidance for the calculation of risk-based screening levels. ADEQ revised these SRLs, effective May 5, 2007. The 2007 SRLs have been used when comparing concentrations to the SRLs unless otherwise noted.

The previous investigations occurred before 1997, when the SRLs were promulgated, or used the 1997 SRLs for comparison during evaluations. To provide consistency, this section compares the results of previous investigations to the 2007 SRLs. Most of the compounds identified in the 2007 SRLs as carcinogens include residential SRL values for both 1×10^{-5} and 1×10^{-6} excess lifetime cancer risks. The 1×10^{-5} risk value may be used during remediation unless a future use of the site will be as a childcare facility or school. Sample results were compared to the 1×10^{-5} risk value for carcinogens because the Site is not currently used for, or anticipated to be used for, a school or daycare facility.

The following sections present an overview of the investigations and IRA, including soil sampling results. The former soil sampling locations are shown on **Figure 1-4**.

1.4.1 Soil Investigations

Soil sampling was conducted during previous investigations by Geraghty & Miller and Arcadis/Geraghty & Miller in 1995 and 1996. The soil sample locations from the 1995 soil investigation and the areas where composite samples were collected prior to and after the 1996 soil removal activities are shown on **Figure 1-4**. The previous soil investigations evaluated the presence of MGP-related contaminants in soil, including PAHs, TPHs, and metals. BTEX was also detected in the oil sludge in the oil sump for waste characterization purposes. The analytical results from former sampling activities for PAHs, TPHs and fuel hydrocarbons, BTEX, and total metals and reactive sulfide are shown in **Tables 1-2, 1-3, 1-4, and 1-5**, respectively. **Table 1-6** provides a description of the previous boring locations and sampling depths. The locations where PAH, lead, arsenic, and TPH were detected during previous investigations are shown on **Figures 1-5, 1-6, 1-7, and 1-8**, respectively, and further identifies the locations with concentrations above residential or non-residential SRLs.

1.4.1.1 October 1995 – Soil Investigation

The October 1995 site investigation included surface and subsurface soil sampling. Fourteen surface soil samples, 23 subsurface, and 2 duplicate samples were collected. Four of the surface samples (SS-8, SS-11, SS-12 and SS-13) were collected from offsite locations to evaluate local background concentrations of MGP-related compounds. Surface sample locations and soil boring locations are shown on **Figure 1-4**.

1.4.1.1.1 Surface Sampling

Fourteen surface samples were collected between the ground surface and 6 inches bgs. Samples were analyzed for PAHs, total cyanide, and total metals by Analytical Technologies Incorporated (ATI) laboratory in Phoenix, Arizona. Analytical results for PAHs are presented in **Table 1-2**, and results for metals and cyanide are presented in **Table 1-5**.

Eight of the surface soil samples exceeded the residential SRLs for select PAHs as follows:

- **SS-1** – Benz(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene
- **SS-5** – Benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene
- **SS-6** – Benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene
- **SS-7** – Benzo(a)pyrene and indeno(1,2,3-cd)pyrene
- **SS-2, SS-10 and SS-14** – Benzo(a)pyrene

Five of the surface soil samples also exceeded the non-residential SRLs for select PAHs as follows:

- **SS-1** – Benzo(a)pyrene, benzo(b)fluoranthene, and indeno(1,2,3-cd)pyrene
- **SS-5** – Benz(a)anthracene, benzo(b)fluoranthene, benzo(a)pyrene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene
- **SS-4, SS-6, and SS-7** – Benzo(a)pyrene

The highest concentrations of all PAHs detected were in sample SS-5. Benzo(a)pyrene was detected at a concentration of 230 mg/kg. The residential SRL for benzo(a)pyrene is 0.69 mg/kg. SS-5 was located on the north end of the Site and was not adjacent to any known former MGP structures. The locations where PAHs were detected above SRLs during the October 1995 investigation are shown on **Figure 1-5**.

Arsenic was detected above the residential and non-residential SRL of 10 mg/kg in 11 of the surface samples (SS-1 through SS-7, SS-9, SS-10, SS-11, and SS-13). The highest concentration of 83.5 mg/kg was detected in sample SS-6. Lead was detected in samples SS-6 and SS-7 at concentrations of 2,530 mg/kg and 2,290 mg/kg, respectively, which is above the non-residential SRL for lead of 800 mg/kg. SS-6 and SS-7 were located adjacent to the southern former gas holder and the purifier structure, respectively. The locations where lead and arsenic were detected above the SRLs during the October 1995 investigation are shown on **Figures 1-6 and 1-7**, respectively. Maximum and mean lead concentrations of 1,170 and 254 mg/kg, respectively, were reported in soil collected from a widespread area in the City and maximum and mean arsenic concentrations of 35.8 and 15 mg/kg, respectively, have been reported by the ATSDR in the same area (ATSDR, 1995). The previous remediation effort (Arcadis/Geraghty & Miller, 1998) assumed that the 1995 ATSDR mean arsenic and lead concentrations were representative in the vicinity of the Site and used the mean arsenic concentration as the target soil quality criteria for arsenic. For this RAP, a statistical evaluation of background metals concentration at or near the Site is provided in Section 3, and the surrounding environmental issues are described in Section 1.2.

1.4.1.1.2 Soil Boring Sampling

Twenty-three subsurface samples were collected from 10 soil borings at depths ranging from 1.5 feet to 21.5 feet. The borings were located near former MGP structures. An onsite ATI mobile laboratory analyzed the subsurface samples for BTEX and TPH. Subsurface soil samples that were visibly degraded were also analyzed for total metals, cyanide, and PAHs at the ATI fixed-base laboratory in Phoenix, Arizona. The analytical results for PAHs, TPHs, BTEX, and total metals are presented in **Tables 1-2, 1-3, 1-4, and 1-5**, respectively.

Samples from borings SB-1, SB-2, SB-6, and SB-9 had detections of at least one PAH compound at depths ranging from approximately 1 foot to 10 feet. The only concentration exceeding a residential and/or non-residential SRL was observed in boring SB-4 at 1.5 feet bgs, with a benzo(a)pyrene concentration of 4.5 mg/kg, which exceeded the non-residential SRL of 2.1 mg/kg. SB-4 was located north of the small purifiers and west of the central gas holder. The remaining PAH results from all borings were below the residential SRL. The locations where PAHs were detected above SRLs during the October 1995 investigation are shown on **Figure 1-5**.

BTEX compounds were not detected above the laboratory reporting limit (RL) of < 0.025 mg/kg in any of the soil boring samples. TPH was detected in three soil borings (SB-1, SB-4, and SB-8), with a maximum

concentration of 4,000 mg/kg in boring SB-4 at a depth of 1.5 feet bgs. The deepest observed TPH concentration was at approximately 10 feet bgs in boring SB-8. The locations where TPH was detected during the October 1995 investigation are shown on **Figure 1-8**.

Arsenic was detected above the residential and non-residential SRL of 10 mg/kg in all samples collected from the 10 soil boring locations, except in 1 sample from boring SB-8. Arsenic concentrations ranged from 8.7 to 42.1 mg/kg at depths of up to 16.5 feet, with the highest concentration of 42 mg/kg detected in boring SB-2 at approximately 10 feet bgs.

1.4.1.1.3 Oil Sump and Purifier Contents Sampling

Waste characterization samples were collected from the sludge in the oil sump and the contents of the large purifier. Two samples were collected from the oil sump contents (one for total metals and one for volatile organic compounds [VOCs] and semivolatile organic compounds [SVOCs] analysis) and one sample was collected from the purifier for reactive sulfide. The oily sludge sample from the oil sump was analyzed for TPH, RCRA metals, VOCs, and SVOCs, and the purifier contents sample was analyzed for sulfides, with the following results:

- Total hydrocarbon concentration of 477,000 mg/kg
- Fuel hydrocarbons measured as C6-C10, C10-C22, and C22-C36, with concentrations of 7,300, 270,000, and 200,000 mg/kg, respectively
- No detections of toxicity characteristic leaching procedure (TCLP) SVOCs (analyzed in accordance with the TCLP preparation for hazardous waste characterization)
- One VOC (xylene) detected at 180 mg/kg
- Lead and barium concentrations of 1.7 and 0.6 milligram per liter (mg/L), respectively (analyzed for RCRA total metals)
- Silver, arsenic, cadmium, chromium, mercury, and selenium were not detected based on total metals analysis

Samples were collected from the contents of the purifier from the surface to approximately 6 inches bgs on October 25, 1995 (sample SS-3) and March 20, 1996 (sample "Purifier"). The results from sample SS-3 were as follows:

- Total arsenic at 17.9 mg/kg, above the residential and non-residential SRLs
- PAH and total metals concentrations below the residential SRLs
- Reactive sulfide concentration of 30.3 mg/kg (no SRL)
- Total sulfur content of approximately 12 percent (no SRL)

The contents of the oil sump and the purifier were not characterized as RCRA hazardous waste during the investigation.

1.4.1.2 June 1996 – Composite Surface Soil Sampling

Based on the October 1995 investigation results, composite surface soil sampling was conducted in the areas where the soil appeared to have been impacted by former MGP operations above ADEQ health-based guidance level criteria. The purpose of the sampling effort was to characterize material that potentially could be disposed of during remedial activities.

Samples were collected within a 20-foot radius of each of the five former surface sampling locations (SS-1 and SS-4 through SS-7) that appeared to have been impacted by MGP operations, based on the analytical results from the previous investigation. Sampling areas are shown on **Figure 1-4**. Composite samples were also collected near the offsite background surface sample locations SS-11 and SS-12. A composite sample of all the samples collected (Sample COMP) was also analyzed. The composite samples were analyzed for TPH, TCLP metals, SVOCs, and total metals to evaluate whether soil would

need to be managed as a RCRA hazardous waste or an Arizona special waste petroleum-contaminated soil (PCS) during remedial activities.

TPH was detected in all composite samples at concentrations ranging from 40 to 780 mg/kg (SS-6 Area). TPH was also detected in the offsite composite sample from Area SS-11/SS-12 at a concentration of 110 mg/kg. TPH concentrations are presented in **Table 1-3**. Concentrations of BTEX compounds were below the laboratory detection limit of 0.025 mg/kg, as presented in **Table 1-4**. **Figure 1-8** shows the composite sampling areas where TPH was detected during the October 1995 investigation.

Arsenic concentrations exceeded the residential and non-residential SRL of 10 mg/kg in samples from Areas SS-4/SS-7 and SS-6. Lead concentrations exceeded the non-residential SRL of 800 mg/kg in the sample from area SS-6 (1,100 mg/kg) and the residential SRL of 400 mg/kg in the sample from area SS-1 (410 mg/kg). Total metals concentrations are presented in **Table 1-5**. The composite sampling areas where lead and arsenic were detected above SRLs during the October 1995 investigation are shown on **Figures 1-6** and **1-7**, respectively.

TCLP metals and TCLP SVOCs were below the RCRA toxicity characteristic limits.

1.4.2 Remedial Activities – Interim Removal Actions

Based on visual observation and data collected from the soil investigations, the following areas were identified for material removal:

- Oil sump contents
- Purifier structure contents
- Surface soil impacted with metals
- Surface soil impacted with hydrocarbons
- Debris and cinder pile impacted with hydrocarbons

Material removal activities were conducted in two phases. Phase I consisted of removing the debris and cinder pile, select surface soil, the contents of the purifier and oil sump, the concrete shed in the northwestern portion of the Site, and the purifier. Phase II consisted of removing additional surface soil. The remedial action levels used were the 1996 non-residential health-based guidance levels for PAHs. An arsenic cleanup criteria of 15 mg/kg was applied during the 1996 remediation effort based on the ATSDR (ATSDR, 1995) background arsenic concentration for the City area that was also used during the 1995 site investigation (described in Section 1.4.1.1.1).

The analytical results for soil sampling activities conducted during the soil investigations and removal actions are shown in **Tables 1-2** through **1-5**. The locations where PAHs, lead, arsenic, and TPH were detected in previous investigations and IRAs are shown on **Figures 1-5, 1-6, 1-7, and 1-8**, respectively, and further identify the locations where concentrations exceeded residential or non-residential SRLs. TPH does not have an associated 2007 residential or non-residential SRL. Details of the Phase I and Phase II IRAs are provided in this section.

1.4.2.1 August 1996 – Phase I Interim Removal Action

The Phase I IRA was performed in August 1996 and consisted of the following:

- Removing the debris and cinder pile
- Removing the oil sump
- Removing the concrete shed and purifier
- Removing impacted surface soil previously identified as being impacted with metals and/or PAHs and performing confirmation sampling to evaluate whether additional soil removal was required

Environmental Response, Inc. (ERI) was the IRA contractor performing demolition and removal activities; Geraghty and Miller prepared the work plan; and Arcadis/Geraghty Miller provided oversight of ERI and collected soil confirmation samples.

1.4.2.1.1 Debris Pile Removal and Sampling

The debris pile was removed in August 1996. An area measuring 130 feet in an east-west direction by 250 feet in a north-south direction was excavated until visibly clean soil was observed. Available information did not indicate the depth of excavation and referred to the samples as "surface samples." The excavated area is shown on **Figure 1-4** (Geraghty and Miller, 1996b).

The material from the debris pile was placed on a shaker apparatus to separate bricks, vegetation, and other miscellaneous debris from the lampblack material. The lampblack was transported to Waste Management's Butterfield Station Regional Landfill as a special waste PCS and the remaining debris was characterized as PCS solid waste.

Following removal of the debris pile, an area measuring 100 feet east-west by 125 feet north-south was divided into twenty 25-foot square sections, as shown on **Figure 1-5**. A composite sample was collected from each section and analyzed for TPH. If TPH concentrations exceeded 30 mg/kg in a grid section sample, an additional foot of soil was excavated, and a second composite sample was collected. Samples were labeled based on the section from which they were collected (i.e., Debris #) with a "B" added if the area was further excavated and sampled again.

Five additional composite samples (Debris A, B, C, D, and E) were collected by compositing the samples from four grid sections. The samples were submitted to the laboratory for the analysis of lead, arsenic, and PAHs. The composite sampling areas are shown on **Figure 1-5**.

Laboratory TPH results of the section samples indicated the initial samples from grid sections 3, 4, 9, and 19 exceeded 30 mg/kg, with a maximum concentration of 590 mg/kg in sample Debris 4. An additional 1 foot of soil was excavated in these areas and a composite sample of the remaining samples was collected. All results from the second sampling effort were below the laboratory detection limit of 20 mg/kg.

One PAH (benzo(a)pyrene) result of 0.7 mg/kg at area Debris A exceeded the residential SRL of 0.69 mg/kg. Arsenic results from area samples ranged from 14 to 19 mg/kg, exceeding the residential SRL for arsenic, with the results consistent with the ATSDR mean and maximum values of 15 and 35.8 mg/kg, respectively (ATSDR, 1995). It should be noted the 1995 site investigation used the best available information to estimate a background arsenic value, using the mean concentration of 15 mg/kg determined from ATSDR information as the background value in 1995. Lead results ranged from 12 to 100 mg/kg and were below the residential SRL of 400 mg/kg in all samples and below the non-residential SRL. Background metals are further discussed in Section 3.

1.4.2.1.2 Oil Sump Removal

The contents of the oil sump were removed on August 13, 1996. Approximately 30 gallons of fluid were removed. The oil sump was removed on August 16, 1996. When removed, the sump was approximately 2.5 feet in diameter and 3.5 feet long, with no perforations. No visible staining of the surrounding soil was observed during sump removal. The oil sump and contents were recycled at the proper facility. No additional soil sampling was performed at the oil sump location.

1.4.2.1.3 Shed and Purifier Removal and Sampling

The concrete shed and purifier were removed in August 1996 and included the following activities:

- On August 5, 1996, Spray Systems Environmental performed an asbestos inspection prior to removing the concrete shed and purifier and submitted a National Emission Standards for Hazardous Air Pollutants notification for demolition of the structures.

- On August 19, 1996, approximately 261 tons of material were removed from the purifier structure and transported to Waste Management's Butterfield Station Regional Landfill as solid waste. The shed and purifier structure were demolished (the concrete pad remained), and approximately 230 tons of concrete from the shed and purifier structure demolition were transported to Speedway Landfill for management as a solid waste.
- On August 20, 1996, composite samples were collected from the following surface locations (**Figure 1-8** and **Table 1-3**) and submitted to the laboratory for TPH analysis:
 - Area adjacent to the north of the purifier (PUR-N)
 - Area adjacent to the south of the purifier (PUR-S)
 - Area adjacent to the east of the purifier (PUR-E)
 - Area adjacent to the west of the purifier (PUR-W)

TPH concentrations in the composite samples ranged from 71 mg/kg at PUR N to 520 mg/kg at PUR E.

- On August 21, 1996, the concrete purifier pad was removed and approximately 78 tons of concrete were transported to Waste Management's Butterfield Station Regional Landfill as solid waste.

Soil to the north and west of the concrete pad was excavated. Depth of the excavation was not provided in the report but is estimated to be approximately 1 foot bgs based on other activities at the site. Soil to the south and east of the pad was not excavated because of the presence of a gas line, which is owned by El Paso Natural Gas.

Composite samples were collected after soil was graded below the purifier pad and north of the purifier pad (the actual depth of sampling was not provided) from the following locations (**Figure 1-8**) and analyzed for arsenic, lead, and TPH:

- Area adjacent to the north side of the purifier (PUR N with 8/21/1996 date)
- Below the former purifier pad (subpurifier)

TPH concentrations were 140 and 57 mg/kg, from PUR N and the subpurifier, respectively. Arsenic concentrations were 11 and 15 mg/kg from PUR-N and the subpurifier, respectively, which are above the residential and non-residential SRLs of 10 mg/kg and below and equal to the ATSDR-determined mean arsenic concentration of 15 mg/kg (Section 1.4.1.1.1).

- On August 22, 1996, the area north of the purifier pad and the area below the purifier pad was regraded and composite samples were collected (PUR N-B and SUBPUR B) and submitted for PAH analysis. Depth of excavation was not provided in the report but is estimated to be approximately 1 foot bgs. PAHs were detected in PUR-N-B below residential SRLs.

The composite sampling locations are shown on **Figure 1-5**.

1.4.2.1.4 Surface Soil Impacted with Metals and PAHs Removal and Sampling

Surface soil sampling results from four locations (SS-4 through SS-7) sampled in October 1995 and June 1996 had detections of arsenic, lead, and PAHs. Because of the proximity of SS-4 and SS-7, these two areas were combined and are referenced as SS4/SS-7, resulting in three material removal areas (SS4-7, SS5, and SS6).

On August 19, 1996, approximately 1 foot of soil was removed from each area, resulting in a total of 894 tons of soil and other materials transported offsite to Waste Management's Butterfield Station Regional Landfill as solid waste PCS.

Samples were collected from the base of the excavation after soil removal and analyzed for TPH, arsenic, lead and PAHs, as follows:

- One composite sample (SS4-7) from combined area SS4/SS7
- One composite sample (SS5 Comp) from excavated area SS-5

- Three composite samples (SS6W, SS6CENT, and SS6E) from the west, central, and eastern portions of area SS-6

TPH was not detected above the laboratory RL of 20 mg/kg in SS-5 and SS-4-7 samples. Lead concentrations were below residential SRLs. Arsenic concentrations of 11 and 15 mg/kg for SS-5 and SS-4/SS-7, respectively, were above the residential and non-residential SRL of 10 mg/kg and below and equal to the mean ATSDR background concentration of 15 mg/kg.

TPH concentrations in SS6W, SS6CENT, and SS6E ranged from 39 to 53 mg/kg; lead ranged from 11 and 217 mg/kg (below the residential lead SRL); and arsenic concentrations ranged from 18 to 24 mg/kg (above the SRL of 10 mg/kg and between the mean and maximum ATSDR background concentration of 15 and 35.8 mg/kg).

A composite sample (SS6 PAH Comp) of SS6W, SS6CENT, and SS6E was also submitted for PAH laboratory analysis. The benzo(a)pyrene result of the composite sample was 2.9 mg/kg, which was above the residential SRL.

1.4.2.2 November 1996 – Phase II Interim Remedial Action

The Phase II IRA was performed in November 1996 for removal of the following:

- Additional soil in the SS-6 area
- Additional soil in the area south and east of the purifier
- Additional soil along the western fence of the Site

Excavated areas were identified based on Phase I IRA results and visibly impacted soil. An Orange Coast Analytical Laboratory was onsite with a mobile laboratory to analyze samples for PAHs and determine the extent of the excavation. Samples were not collected from under the generator house, meter house, small purifiers, or gas holder foundations. An El Paso Natural Gas representative was onsite to assist representatives of Arcadis/Geraghty Miller in locating the El Paso gas line.

1.4.2.2.1 Removal Activities

Additional removal activities were conducted on November 4 and 5, 1996, as follows:

- On November 4, 1996, approximately 1 foot of soil was removed from the SS-6 area and composite samples (SS6WC, SS6CC, and SS6EC) were collected from the west, center, and east areas of the excavation and analyzed for PAHs. All sample results were below the residential SRL.
- On November 5, 1996, visibly impacted material was removed from the west fence line and a composite sample (WESTFENCE) was collected for PAH analysis. All sample results were below the residential SRL.
- On November 5, 1996, 1 foot of soil was removed from the south and east of the former purifier and three composite samples were collected (PURS31, PURS32, and PURE31) and analyzed for PAHs with the following results:
 - PURS31 results for benzo(a)pyrene (6.6 mg/kg) and benzo(a)anthracene (6.9 mg/kg) exceeded the non-residential and residential SRLs, respectively.
 - PURS32 result for benzo(a)pyrene (1.8 mg/kg) exceeded the residential SRL.
 - PURE31 result for benzo(a)pyrene (0.64 mg/kg) was below the residential SRL.
- Because of the presence of MGP-impacted soil, an additional 1.5 feet of soil were excavated at these locations and two additional composite samples (PURS41 and PURS42) were collected. Benzo(a)pyrene exceeded the residential SRL with a result of 1.5 mg/kg at the PURS42 location. The remaining PAH results were less than the residential SRL.

Approximately 380 tons of material were removed during Phase II activities and transported to Waste Management's Butterfield Station Regional Landfill as solid waste PCS. Upon completion of Phase II activities, approximately 400 tons of clean fill material were used to regrade the Site.

1.4.2.2.2 Investigation-derived Waste

ERI transported the material removed from the site. All petroleum-contaminated material removed during 1996 was transported to Waste Management's Butterfield Station Regional Landfill for management as PCS. All petroleum-contaminated material removed during 1997 was transported to Waste Management's Butterfield Station Regional Landfill for management as a special waste PCS. The uncontaminated solid waste was transported to Speedway Landfill in Tucson, Arizona. The oil sump contents were transported to Allen Moore Diversified Services Incorporated in Chandler, Arizona, to be recycled. The oil sump itself was transported to EMCO Recycling in Phoenix, Arizona, to be recycled (Arcadis/Geraghty & Miller, 1998).

1.5 Site Conditions Prior to Pre-Design Testing Investigation

After the site investigations and IRAs of the 1990s and prior to the pre-design testing investigation in 2019, dumping of construction materials took place at the Site. From 1998 to 2019, construction debris and soil piles accumulated, covering the majority of the City property and private property at the Site with 10-foot-high debris piles. The City removed the debris piles to enable pre-design testing investigation activities.

Based on historical data from previous material removal activities (Arcadis/Geraghty & Miller, 1998), the following five areas at the Site contain soil with concentrations above the current benzo(a)pyrene residential SRL:

- The previous removal action reported an Area A-2 sample concentration of 0.7 mg/kg within the debris and cinder pile removal area after the previous remediation efforts, which is above the current benzo(a)pyrene SRL of 0.69 mg/kg. Pre-design boring B19 within the debris and cinder pile area and Debris A area was used to evaluate this location.
- The benzo(a)pyrene results for the PUR-S 32/42 area south of the former large purifier (which was removed) and northwest of the small northwest purifier pad were 1.8 (PURS32) and 1.5 mg/kg (PURS42) at 1 foot and 2.5 feet bgs, respectively, after the previous remediation efforts. Pre-design boring B17 was used to evaluate this area.
- The benzo(a)pyrene result for the SS-10 surface sample collected west of Gas Holder 1 and south of the former debris pile was 1.3 mg/kg. Pre-design boring B22 was used to evaluate the SS-10 location.
- The benzo(a)pyrene result for the SS-14 surface sample collected north of Gas Holder 2 was 0.76 mg/kg. Pre-design boring B23 was used to evaluate the SS-14 location.
- The benzo(a)pyrene result for the SS-5 surface sample collected north of former MGP operations was 230 mg/kg, in addition to benzo(b)fluoranthene, benzo(a)anthracene, indeno(1,2,3-cd)pyrene, benzo(k)fluoranthene, and dibenzo(a,h)anthracene results of 170, 160, 160, 93, and 8.6 mg/kg, respectively. Results from the 1996 IRA at this location indicated reductions of all PAHs to below residential SRLs after soil excavation. However, the excavation appears to have been conducted off center to SS-5 location. Pre-design boring B21 was used to evaluate PAH concentration north of the SS-5 excavation location and SS-5 surface sampling location.

The 1997 post-remediation PAH concentrations listed in the previous bullets and associated boring locations and the 2019 pre-design testing investigation results for PAHs above the residential SRL are shown on **Figure 1-9**. The sampling depths during the previous investigation are also shown on **Figure 1-9**.

The Site surface elevation has likely changed between 1998 and 2019 due to the accumulation and removal of surface soil between 1998 and 2019. Therefore, the recent pre-design testing data have been used to evaluate the current Site surface conditions. As described previously, some of the 2019 pre-design surface sample locations were designed to evaluate the existing surface conditions based on the

1996 results (Debris A-2, SS-10, and SS-14). At these locations (B-19, B-22, and B-23), surface sample results for PAHs were below the residential SRLs.

The 1996 soil boring data were all below the residential PAH SRLs except for soil boring SB-4, which had a benzo(a)pyrene result of 4.5 mg/kg at 0 to 1.5 feet bgs. Soil boring SB-4 was located within the PURS32/42 excavation area, which was excavated to 2.5 feet bgs, thereby removing the SB-4 area of high PAH concentration. Depths of sample collection during the 1996 investigation were inconsistent, meaning some borings were sampled only at 9 to 10.5 feet bgs, while others were sampled at 0 to 1.5, 3 to 3.5, 4.5 to 6, 9 to 10.5, 15 to 16.5, or 20 to 21.5 feet bgs, or a combination of these sample depths. The soil boring sampling depths during the 1996 investigation are shown on **Figure 1-9**. The 2019 pre-design testing investigation soil boring depths were sampled at a minimum of every 5 feet to a minimum depth of 20 feet bgs, with soil borings within the Site extent also including the sample intervals at 2.5 to 3 and 7.5 to 8 feet bgs.

Prior to pre-design testing investigation activities, a site fence was installed to prevent dumping at the Site. AZTEC Engineering Group Inc. performed a property boundary survey the week of October 7, 2019, and Daryca installed a Site security fence with a lockable entrance gate between October 14 and 28, 2019.

2. Pre-design Testing Investigation

Jacobs completed pre-design testing investigation activities between October 27, 2019 and November 8, 2019. The purpose of the pre-design activities was to:

- Evaluate surface and subsurface soil contamination to further define vertical and lateral extents of MGP-related compounds at the Site.
- Evaluate background metals concentrations near the Site.
- Evaluate Site engineering properties of the soils prior to full-scale remediation design.

The pre-design testing investigation was completed on November 8, 2019. Prior to conducting the pre-design testing investigation, Jacobs prepared a work plan to identify the activities to be accomplished and the methodologies to be used during the investigation (Jacobs, 2019b). The work plan was reviewed and approved by ADEQ in an email dated September 6, 2019. The approved work plan is provided in **Appendix C**.

The activities performed during the pre-design testing investigation between October and November 2019 are summarized as follows:

- Utility Evaluation. The utility evaluation identified utility locations and underground structures that could impact the investigation and/or remedial activities.
- Property Ownership Evaluation and Surveying. A site survey and evaluation were performed to identify property boundaries (completed before the pre-design testing investigation), identify the wash location, and prepare a topographic map of the Site (completed after the pre-design testing investigation).
- Subsurface Soil Investigation.
 - 14 onsite soil borings (borings B11 through B17, B19 through B21, and B23 through B26) were advanced during the pre-design testing investigation to obtain the necessary engineering design parameters (IE moisture content, density, Atterberg limits, etc.) for the full-scale remediation and further define the vertical and lateral extents of contamination. The locations of the pre-design testing investigation borings are shown on **Figure 2-1**. Because the El Paso/Southwest Gas pipeline crosses the Site, borings were prohibited within 10 feet of the high-pressure gas pipeline.
 - 11 offsite soil borings (borings B18, B22, and B27 through B35) were advanced and sampled during the pre-design testing investigation. The primary purpose of the offsite borings was to evaluate background concentrations for lead and arsenic from locations outside the Site and confirm the delineation of vertical and lateral extents of impacts. All borings were analyzed for PAHs and total metals.

2.1 Utility Evaluation

The objective of the utility evaluation was to identify utility locations and potential issues, such as underground structures, that could impact the soil investigation and remedial design. These data are useful to clear boring locations and reveal utility conditions that may need to be addressed during the full-scale remedy. Blue Stake Utility Marking Services was called to locate and mark all functional and abandoned utilities. Utilities were further designated by AZTEC using non-invasive geophysical methods. After the utilities were located, they were surveyed by AZTEC. The utilities at the Site based on the available information and surveys are shown on **Figure 2-2**.

2.2 Property Ownership and Surveying

AZTEC also identified property boundaries based on available Cochise County title information and legal descriptions. The property boundaries, as well as the approximate locations of former MGP structures, are shown on **Figure 2-2**.

2.3 Pre-design Testing Investigation

The objectives of the pre-design testing investigation were to:

- Further evaluate the vertical and lateral extents of contamination at the Site.
- Collect data to evaluate background lead and arsenic levels near the Site.
- Obtain engineering parameters (IE moisture content, density, Atterberg limits, etc.) for use in evaluating treatment options.
- Determine methods of excavation for remedial activities.
- Collect data to complete a human health risk assessment (HHRA) and groundwater protection level (GPL) modeling.
- Evaluate treatment options and select a final remedy.

A description of the sampling locations and associated rationale for the pre-design testing investigation is presented in **Table 2-1**.

2.3.1 Soil Borings

Prior to advancing soil borings, a surface sample was collected at a depth of 1 to 3 inches bgs at all pre-design testing investigation soil boring locations. The top 1 inch of surface debris was removed prior to surface sample collection.

Cascade Drilling Services advanced 25 soil borings during the pre-design testing investigation. Twenty-two shallow borings were advanced up to 25 feet bgs (above groundwater) using a track-mounted 8-inch hollow-stem auger drill rig and three soil borings were advanced 50 feet bgs (below the depth to groundwater) using an 8-inch core barrel with a Sonic 600 SC drill rig. Prior to drilling, all borings were hand cleared for utilities between 5 and 10 feet bgs. A Jacobs field engineer/geologist specified the boring locations based on the proposed locations in the work plan and field conditions and observed the drilling operations. Total boring depth sampling intervals, soil conditions, and materials encountered were recorded by Jacobs personnel for each boring. All pre-design boring depths were referenced to the ground surface elevation at the time of drilling. At the conclusion of drilling activities (week of November 11, 2019), a survey of the boring locations and elevations was performed by AZTEC. The elevations and locations recorded during the survey reflect pre-design ground surface conditions during drilling, but likely differ from historical Site surface elevations due to soil and debris being dumped on the site between 1998 and 2019.

Three groundwater monitoring wells were installed at borings B25, B26, and B27. The remaining shallow soil borings advanced to a total depth above groundwater were backfilled with bentonite grout slurry up to approximately 2 feet bgs, followed by native soil to the existing grade. Soil cuttings from each boring were placed in a roll-off container and securely stored onsite pending laboratory analysis. Waste characterization and disposal are discussed in Sections 2.4 and 7.4.8. Boring and well construction logs are presented in **Appendix D** and **Appendix E**, respectively.

To evaluate background conditions, borings were located offsite. Offsite borings are defined as borings advanced outside the Site extent and boundary of historical MGP operations (**Figure 2-1**) with

benzo(a)pyrene results below residential SRLs. Offsite borings include borings B18, B22, and B27 through B35. Onsite borings are defined as borings advanced inside the Site extent or at locations with benzo(a)pyrene results above the residential SRLs. Onsite borings include borings B11 through B17 and B19 through B26.

The hollow-stem auger drilling technique was used to advance shallow soil borings with total depths ranging from 15 to 25 feet bgs. Samples were generally collected at 0, 2.5, 5, 7.5, 10, 15, and 20-foot intervals at onsite locations and at 0, 5, 10, 15, and 20-foot intervals at offsite locations.

The shallow soil borings include the following:

- Boring B11 – Advanced at the location of the former south gas holder to a depth of 20 feet bgs to evaluate the vertical extent of the MGP-related contamination near the former south gas holder.
- Boring B12 – Advanced at the location of the former north gas holder to a depth of 25 feet bgs to evaluate the vertical extent of the MGP-related contamination near the former north gas holder.
- Boring B13 – Advanced at the location of the former meter house to a depth of 20 feet bgs to evaluate the vertical extent of the MGP-related contamination near the former meter house.
- Boring B14 – Advanced at the location of the east end of the former generator house to a depth of 20 feet bgs to evaluate the vertical extent of the MGP-related contamination near the former generator house.
- Boring B15 – Advanced at the location of the north end of the former generator house to a depth of 15 feet bgs to evaluate the vertical extent of the MGP-related contamination near the former generator house.
- Boring B16 – Advanced at the location of the former oil sump to a depth of 20 feet bgs to evaluate the vertical extent of the MGP-related contamination near the former oil sump.
- Boring B17 – Advanced west of the location of the former purifiers to a depth of 20 feet bgs to evaluate the vertical extent of former MGP-related contamination near previously sampled locations PURS32/PURS42.
- Boring B18 – Advanced northeast of the Site to a depth of 15.5 feet bgs to evaluate background metals and horizontal extent of former MGP-related contamination northeast of the Site.
- Boring B19 – Advanced on the northwest side of the former debris and cinder pile to a depth of 20 feet bgs to evaluate the vertical and horizontal extents of former MGP-related contamination at the debris and cinder pile.
- Boring B20 – Advanced to the north of the former debris and cinder pile to a depth of 20 feet bgs to evaluate the horizontal extent of former MGP-related contamination near the debris and cinder pile.
- Boring B21 – Advanced to the north of the previous investigation SS-5 location to a depth of 25 feet bgs to evaluate the horizontal extent of former MGP-related contamination near the SS-5 location.
- Boring B22 – Advanced to the south of the previous investigation SS-10 location to a depth of 15.5 feet bgs to evaluate background metals concentrations and the horizontal extent of former MGP-related contamination near the SS-10 location.
- Boring B23 – Advanced to the east of the previous investigation SS-14 location to a depth of 20 feet bgs to evaluate the horizontal extent of former MGP-related contamination near the SS-14 location.

- Boring B24 – Advanced west of the location of the former purifiers to a depth of 20 feet bgs to evaluate the horizontal extent of former MGP-related contamination east of the former purifiers.
- Boring B25 – Advanced west of the debris and cinder pile to a depth of 50 feet to evaluate the horizontal extent of MGP-related contamination in soil and potential impacts to groundwater. A groundwater well was installed at this location and screened from 25 to 45 feet bgs.
- Boring B26 – Advanced south of the gas holders to a depth of 50 feet to evaluate the horizontal extent of MGP-related contamination in soil and potential impacts to groundwater. A groundwater well was installed at this location and screened from 25 to 45 feet bgs.
- Boring B27 – Advanced southwest of the Site to a depth of 50 feet to evaluate background metals concentrations in soil and groundwater. A groundwater well was installed at this location and screened from 22 to 42 feet bgs.
- Boring B28 – Advanced southwest of the Site to a depth of 20 feet bgs to evaluate background metals concentrations near the Site.
- Boring B29 – Advanced south of the Site to a depth of 21 feet bgs to evaluate background metals concentrations near the Site.
- Boring B30 – Advanced northeast of the Site to a depth of 20 feet bgs to evaluate background metals concentrations near the Site.
- Boring B31 – Advanced north of the Site to a depth of 21 feet bgs to evaluate background metals concentrations near the Site.
- Boring B32 – Advanced north of the Site to a depth of 21 feet bgs to evaluate background metals concentrations near the Site.
- Boring B33 – Advanced north of the Site to a depth of 21 feet bgs to evaluate background metals concentrations near the Site.
- Boring B34 – Advanced northwest of the Site to a depth of 21 feet bgs to evaluate background metals concentrations near the Site.
- Boring B35 – Advanced west of the Site to a depth of 21 feet bgs to evaluate background metals concentrations near the Site.

The sonic drilling method was used to advance soil borings B25, B26, and B27 up to 50 feet bgs and into the groundwater. These borings were advanced to assess the lateral and vertical extents of potential soil contamination, evaluate background lead and arsenic concentrations near the Site, and assess potential MGP-related impacts to groundwater. Groundwater wells were installed at two onsite locations (B25 and B26) and one offsite location (B27) in November 2019. Soil samples were collected at 0, 2.5, 5, 7.5, 10, 15, 20, 30, and 40-foot intervals at the sonic boring locations, and groundwater wells were installed and screened from 25 to 45 feet bgs. Section 2.3.2 provides the details of well installation, development, sampling, and groundwater sampling results.

2.3.1.1 Soil Results

Soil samples were collected from the soil borings for environmental analysis in accordance with the work plan (Jacobs, 2019b). All soil samples were submitted to Xenco Laboratories (ADHS No. AZ0757) in Phoenix, Arizona, and analyzed at Xenco's Texas facility for the following:

- PAHs using EPA Method 8270D-SIM
- Total metals using SW6020/7471B

Samples collected at pre-determined locations were also analyzed for the following:

- VOCs using EPA 8260B (select sample locations)
- Fraction of organic carbon (foc) (ASTM D2974; included with geotechnical results; **Table 2-2**)

All samples collected in October and November 2019 were analyzed for PAHs and metals, with select sample locations also analyzed for VOCs based on the Site history. Soil sample analytical results for PAHs, metals, and VOCs are provided in **Tables 2-3, 2-4, and 2-5**, respectively. Laboratory analytical reports are presented in **Appendix G**. The data quality evaluation of the analytical results is presented in **Appendix H**. The previous locations of SRL exceedances for PAHs and arsenic are shown on **Figures 1-5 and 1-7**, respectively. The locations of SRLs exceedances for PAHs and metals during the pre-design testing investigation are shown on **Figures 2-3 and 2-4**, respectively. All soil VOC results were below the residential soil SRLs.

Soil PAHs

Concentrations of PAHs exceeded residential and/or non-residential SRLs in 25 samples collected from 9 boreholes (B-11 through B-13, B-15 through B-17, B-20, B-21, and B-24). PAH results from samples collected from offsite borings (B-18, B-22, and B-27 through B-35) were below the residential SRLs. Soil borings that did not have PAH results above the residential SRL and that are located outside the Site extent based on historical MGP operational data are classified as offsite locations. Offsite locations include borings B-18, B-22, B-27, B-28, B-29, B-30, B-31, B-32, B-33, B-34, and B-35. The PAH analytical results compared to their respective SRLs, if applicable, are shown in **Table 2-3**. The boring locations and PAH results above the SRLs are shown on **Figure 2-3**.

PAH soil results from the deeper borings (B-25 through B-27) were all below the residential SRL.

PAH analytical results above the residential SRLs from onsite borings are summarized next.

Benzo(a)pyrene was detected above the residential SRL of 0.69 mg/kg in 25 samples and above the nonresidential SRL of 2.1 mg/kg in 14 samples collected from 9 borings. Boring B-13 had the highest benzo(a)pyrene result of 28.9 mg/kg from 1 to 1.5 feet bgs, and boring B-12 had the deepest benzo(a)pyrene result of 1.38 mg/kg (above the residential SRL) from 19.5 to 20 feet bgs. The following table includes the deepest sampled depth, deepest result greater than the residential SRL, and deeper results less than the residential SRL. Because benzo(a)pyrene has had the highest concentrations above SRLs at all borings where detections have been above the SRLs, benzo(a)pyrene has been used as an indicator compound. Borings with results above the residential benzo(a)pyrene SRL are listed in the following table:

| Boring | Total Sampled Depth (feet bgs) | Deepest Result > Residential SRL | Deepest Result < Residential SRL |
|--------|-----------------------------------|-------------------------------------|-------------------------------------|
| B-11 | 20 | 3 | 5.5 |
| B-12 | 25 | 20 | 25 |
| B-13 | 20 | 10.5 | 15.5 |
| B-15 | 15 | 8 | 10.5 |
| B-16 | 20 | 8 | 10.5 |
| B-17 | 20 | 10.5 | 15.5 |
| B-20 | 20 | 5.5 | 8 |
| B-21 | 25 | 15.5 | 20 |
| B-24 | 20 | 15.5 | 20 |

Soil Lead and Arsenic

Arsenic was detected in all 25 borings advanced during the pre-design testing investigation. Concentrations of arsenic exceeded the residential and nonresidential SRL of 10 mg/kg in 123 samples collected from 25 boreholes, with concentrations ranging from 10.3 to 50.3 mg/kg.

Lead was detected above the residential SRL of 400 mg/kg in two samples collected at borings B11 and B12 (samples B11-2.5-3.0 and B12-7.5-8.0), with results of 420 mg/kg and 531 mg/kg, respectively. Due to the elevated lead concentrations, these samples were analyzed for TCLP metals for waste profiling.

Arsenic and lead data from offsite borings B-18, B-22, and B-27 through B-35 have been used to evaluate background arsenic and lead concentrations near the Site. In Section 5, the methodology and results of the statistical evaluation are discussed. The metals analytical results compared to their respective SRLs, if applicable, are shown in **Table 2-4**. The locations and concentrations of arsenic onsite and offsite and concentrations of lead onsite are shown on **Figure 2-4**.

2.3.1.2 Geotechnical Analysis

Select samples were analyzed for geotechnical parameters during the pre-design testing investigation in October and November 2019. Laboratory tests to determine pertinent index and engineering properties were performed by Hoque & Associates in Phoenix, Arizona. The purpose of the index testing program was to classify soil in areas potentially needing excavation and aid in developing engineering parameters for the materials.

Samples were analyzed using the following geotechnical tests:

- Moisture content (ASTM D2216)
- Sieve analysis (percent passing No. 200)
- Atterberg limit (plastic limit, liquid limit, plasticity index)
- In situ density
- Undrained shear strength
- Dry bulk density (ASTM C128)
- Specific gravity (ASTM D854)

In addition, foc was analyzed by Xenco Laboratories and included with the geotechnical testing. A summary of the geotechnical test results is presented in **Table 2-2**, and geotechnical laboratory results are included in **Appendix F**.

2.3.2 Groundwater Well Installation and Results

Cascade Drilling advanced borings D-MW25, D-MW26, and D-MW27 to 50 feet bgs using a rotasonic drill rig and 8-inch core barrel. Monitoring wells D-MW25, D-MW26, and D-MW27 were installed at borings B25, B26, and B27 on November 1, 3, and 4, respectively. All wells were installed at the same depths and used the same well construction. Each well was screened from 25 to 45 feet bgs using 4-inch-diameter schedule 40 polyvinyl chloride with a 0.010 inch screen slot size. A filter pack was installed around each screen from 22 to 50 feet bgs. A bentonite seal was installed and hydrated for at least 30 minutes from 20 to 22 feet, followed by the addition of cement grout from 0 to 20 feet bgs. An above-grade lockable steel monument was set in a 2 by 2-foot concrete pad completion.

Cascade developed monitoring wells D-MW25, D-MW26, and D-MW27 on November 5 and 6, 2019, with a well development rig within a week of installation, using a combination of bailing, surging, bailing, and pumping. The bentonite and cement grout seals were allowed to set overnight prior to well development. To begin development, the well was bailed to remove sediment that had settled within it during installation. After sediment removal, the well was surged using a surge block for a minimum of 20 minutes at 10-foot intervals along the 20-foot well screen to draw fine sediment out of the adjacent annular space and formation and into the well. After surging, the well was again bailed to remove any sediment generated. Finally, the well was pumped with a submersible pump for at least an hour, which was

sufficient to reduce groundwater well turbidity to below 5 nephelometric turbidity units. Both well depth and the firmness of the well bottom were monitored with a tag line throughout development to track the amount of sediment present and verify its removal during bailing. During pumping, groundwater parameters, including temperature, specific conductance, dissolved oxygen, pH, and oxidation-reduction potential, were monitored with a water quality meter by a Jacobs geologist. Well construction diagrams and development logs are provided in Appendix E

2.3.2.1 Monitoring Well Sampling

Groundwater samples were collected after well development at monitoring wells D-MW25, D-MW26, and D-MW27 using a new disposable bailer at each well. Wells were allowed to equilibrate for approximately 24 hours prior to sample collection. Groundwater samples were collected directly from the bailers. One duplicate sample was collected from monitoring well D-MW27 (D-FD01-110719). Collected groundwater was transferred to appropriate sample containers, placed in an iced cooler, and submitted to Xenco Laboratories for laboratory analysis for the following parameters:

- PAHs using EPA Method SW846 8270D-SIM
- Total Recoverable Metals using EPA Method 200.8/245.1
- VOCs using EPA Method SW846 8260C

2.3.2.2 Groundwater Results

All groundwater results for PAHs and metals were below the Arizona Aquifer Water Quality Standard (AWQS). All groundwater results for VOCs were below the AWQS, with the exception of trichloroethene (TCE), which was reported at all three wells.

PAHs

Based on groundwater results, groundwater has not been impacted by PAHs or former MGP-related soil impacts. Groundwater wells MW-25 (boring B-25), MW-26 (boring B-26), and MW-27 (boring B-27) had groundwater results below the laboratory reporting limits and the AWQS and soil results were below the PAH residential SRLs. PAHs are not considered COCs in groundwater.

Metals

All groundwater metal results were below the AWQS; therefore, metals are not considered COCs for groundwater at the Site.

The three groundwater samples collected had arsenic results ranging from 0.00466 to 0.0068 mg/L. All groundwater arsenic results were below the AWQS arsenic standard of 0.05 mg/L. Arsenic is not considered a COC for groundwater.

VOCs

Groundwater samples collected from groundwater wells MW-25 (boring B-25), MW-26 (boring B-26), and MW-27 (boring B-27) had TCE results of 0.0129, 0.0780, and 0.0688 mg/L, respectively, above the AWQS of 0.005 mg/L. 1,1-Dichloroethene and toluene also were detected and were below the AWQS. TCE concentrations in groundwater are not a Site COC for the following reasons:

- Chlorinated VOCs are not a COC for former MGP sites (GRI, 1996).
- MGP operated at the site from approximately 1903 to 1932, which pre-dates the development and use of chlorinated VOCs in the United States in the 1950s.
- Toluene results above the laboratory reporting limit ranged from 0.00224 to 0.00792 mg/L. Based on the groundwater gradient (discussed in Section 2.3.2.3), upgradient underground tanks containing

gasoline/BTEX sources (including toluene) were reported in the EDR report. A conditionally exempt small quantity generator also is located generally upgradient.

2.3.2.3 Groundwater Gradient

Depth-to-water measurements were collected at all monitoring wells on November 7, 2019, approximately 24 hours after wells were development and prior to groundwater sampling, with results of 26.48, 28.79, and 29.38 feet below top of casing at wells MW-25, MW-26, and MW-27, respectively. On November 12, 2019, Aztec performed a survey of the groundwater well locations. The top of casing of each well was surveyed using the North American Vertical Datum of 1988, with results of 3945.0102, 3949.1597, and 3947.1868 feet above mean sea level for wells MW-25, MW-26, and MW-27, respectively. Groundwater elevations at the Site were calculated by subtracting distance from groundwater to the top of casing from the surveyed top of casing elevation. The resulting groundwater direction is approximately toward the west-southwest, with a 0.008-foot-per-foot gradient. Groundwater flow is shown on **Figure 2-5**.

2.3.3 Decontamination

The split-spoon samplers and sampling sleeves were decontaminated prior to use and between sampling locations. Samplers and sleeves were scrubbed using Alconox® and distilled water, followed by a distilled water rinse. Samplers were allowed to air dry prior to use. The drilling augers and core barrels were pressure-washed prior to drilling at each boring location.

Two equipment blanks, D-EB01-102919 and D-EB01-110219, were collected from the split-spoon samplers and sleeves at both the auger drill rig and the sonic drill rig, respectively, and analyzed for PAHs, metals, total VOCs (BTEX was included in total VOCs). All results were below the laboratory RL except for barium. Barium was detected at 0.00711 mg/L from the equipment blank collected on October 29, 2019. The Arizona water quality standard (drinking water protected use) for barium is 2 mg/L.

2.4 Waste Characterization from Soil Sampling Activities

Soil cuttings generated from the soil borings were placed in a lined roll-off container equipped with a locking lid. After all soil cuttings had been placed into the bin, a four-point composite sample (D-BIN-110719) was collected from the roll-off on November 7, 2019, and submitted to Xenco Laboratories for analysis. The bin and soil cuttings remained onsite pending analytical results, with a "Pending Laboratory Analysis" label on the bin that identified the bin contents, date of generation, and contact information. Upon receipt of the waste characterization results, the soil was profiled by APS and is pending approval for disposal at the Marana Regional Landfill in Marana Arizona; manifests will be included in **Appendix I** upon disposal.

Groundwater produced during well development and decontamination water were stored in three 300-gallon polyethylene tote containers. Groundwater produced during well development remains onsite pending analytical results for profile approval and disposal.

Used, disposable personal protective equipment (PPE) and used disposable equipment were bagged and included with the drilling consumable trash. These wastes were not considered hazardous and were sent to a municipal landfill.

During the investigation, waste characterization soil samples were collected from the ground surface to a depth of 5.5 feet bgs at various locations and analyzed to identify proper waste disposal during the remedial activities. Samples were submitted to Xenco Laboratories and analyzed for the following:

- PAHs using EPA Method SW846 8270D-SIM
- Total RCRA 8 Metals using EPA Method 6020/7471B
- TCLP RCRA metals using EPA Method (6010C/7470A)
- Total VOCs using EPA Method 8260C
- Polychlorinated biphenyls (PCBs) using EPA Method 8082A
- Paint filter using EPA Method 9095B (for liquid/saturated samples)

- Ignitability SW846 1010
- pH using EPA Method 9045C (for liquid samples)
- Total cyanide using EPA Method 9012

During the investigation, a small amount of black matter similar in appearance to tar was observed in the drill cuttings at borings B-12 and B-30 at 5 feet bgs. The tar-like matter was collected in a laboratory-provided sample jar, submitted to Xenco Laboratories as sample D-TAR-01, and analyzed for VOCs, TCLP metals, and TCLP VOCs. All results from the tar sample were below the laboratory RLs with the exception of barium, which had a TCLP result of 1.35 mg/L. A summary of waste characterization results for soil and water is provided in **Table 2-9** and **Table 2-10**, respectively.

2.5 Known Extents of Site Impacts

The extents of impacted soil and groundwater at the Site are discussed in the following sections. Information from previous investigations (Section 1) and data from the pre-design testing investigation were used for the evaluations and area discussed in this section. Depths of impacts are based on the depth from the ground surface at the time of pre-design testing investigation sampling and are represented by the topographical survey performed during the week of November 11, 2019. The topographical survey was conducted immediately after the sampling activities in the pre-design testing investigation. The ground surface elevation may differ between historical MGP operations, previous investigations, and pre-design testing investigation activities.

As described in Sections 1.4 and 1.5, the historical accumulation and subsequent removal of surface soil between 1998 to 2019 has altered the Site surface conditions. It is likely that the surface conditions existing during the 1998 investigation did not exist in 2019. Therefore, the surface sampling data collected during the pre-design testing investigation and the subsurface data from the previous investigations and pre-design testing investigation will be primarily relied upon to evaluate potential former MGP-related impacts. In addition to the pre-design testing investigation samples collected inside the known Site extent, offsite borings were advanced to evaluate background metals concentrations and potential MGP-related impacts. In areas where exceedances of residential SRLs existed in 1998, follow-up sampling was conducted in 2019 and is discussed in this section.

2.5.1 Soil Detections

Available data indicate the potential impacts to soil from former MGP operations are generally limited to the upper 15 feet of soil, with one sample result above the residential SRL for benzo(a)pyrene at 19.5 to 20 feet bgs. During the pre-design testing investigation, a definitive layer of lamp black material was not observed, though it is sometimes seen at former MGP sites; however, thin black lines approximately 1 millimeter thick and up to 15 millimeters long of potential MGP material were observed between 2.5 to 10 feet bgs at the onsite boring locations. Historical reports from the 1990s have limited subsurface boring data; however, boring SB-4 had a benzo(a)pyrene concentration of 4.5 mg/kg at 3 to 4.5 feet bgs. In soil boring B17 (near SB-4), the pre-design sampling result for benzo(a)pyrene was 5.31 mg/kg at 2.5 to 3 feet bgs, confirming a benzo(a)pyrene concentration is above the non-residential SRL at this location. Lead was reported above the residential SRL at 2.5 to 3 feet bgs (420 mg/kg) in boring B11 and at 7.5 to 8 feet bgs (531 mg/kg) in boring B12 during the pre-design testing investigation. Arsenic was above the SRL in the majority of the borings, both onsite and offsite, without strong variability. A statistical evaluation of background lead and arsenic concentrations is provided in Section 5. Location specific impacts are discussed next. A correlation was not observed between lead and arsenic or between PAHs and lead and arsenic, meaning the highest lead and arsenic concentrations did not correspond to the highest PAH concentrations.

PAHs

PAHs in soil were observed primarily at and around the former gas holders and meter house locations and along the north extent of the Site. The only previous investigation soil boring with a reported PAH result above the residential SRL was SB-4, with a result of 4.5 mg/kg benzo(a)pyrene at 0 to 1.5 feet bgs. Soil boring SB-4 was also sampled at 3 to 3.5 and 9 to 10.5 feet bgs, with results below the laboratory

reporting limit of 0.017 mg/kg. The SB-4 boring was located between the meter house and north gas holder next to the 2019 boring B-17. The highest PAH concentration was reported at the former meter house location (boring B-13), with a benzo(a)pyrene result of 28.9 mg/kg from 1 to 1.5 feet bgs. PAH concentrations were detected above the residential and/or non-residential SRLs at the former gas holders and meter house locations. The deepest PAH concentration of 1.38 mg/kg benzo(a)pyrene was detected at 20 feet bgs at the north gas holder location.

North of the Site, PAH concentrations have been defined north of the wash at borings B-31, B-32, B-33, and B-34. Detections in these borings were below the residential SRLs for PAHs. The extent of PAHs at the wash have not been defined.

East of the Site, PAH concentrations extended to 15.5 feet bgs at boring B-24, with a benzo(a)pyrene result of 0.877 mg/kg, and a maximum benzo(a)pyrene concentration of 1.22 mg/kg at 10.5 feet bgs. The eastern extent of PAH-impacted soil has not been defined; however, the northeast and southeast extents of impact have been defined and MGP operations did not extend farther east beyond the B-24 soil boring location.

South of the Site, PAH concentrations have been defined south of the southern former gas holder. Detections in borings B-26, B-22, and B-28 were below the residential SRLs for PAHs. Also, detections in borings B-29 and B-27 south of the southern Site fence line are below all residential SRLs for PAHs.

West of the Site, PAH concentrations have been defined. Detections in borings B-19, B-25, B-18, and B-35 were below the residential SRLs for PAHs.

VOCs

Soil samples were analyzed for BTEX during the previous investigations and VOCs were analyzed during the pre-design testing investigation. BTEX was not detected in Site soil during the previous investigations; however, a sludge sample was collected for waste disposal purposes from the former oil sump prior to the sump's removal. The result for total xylenes was 180 micrograms per liter. During the previous investigations, soil samples were not collected after removal of the former oil sump, so during pre-design testing investigation, soil samples were collected and analyzed for total VOCs at the former oil sump location (boring B-16) at 2.5, 5, 7.5, 10, 15, and 20 feet bgs. All VOC results were below the residential VOC SRLs and the laboratory RLs.

Boring B-13 (former meter house location) was the only location with VOC results above the laboratory RLs, as well as detections below the residential SRLs at 1.5 and 3 feet bgs. VOCs detected at 1.5 feet bgs included benzene (0.509 mg/kg), naphthalene (28.3 mg/kg), toluene (0.38 mg/kg) and total xylenes (0.33 mg/kg). A naphthalene result of 10.5 mg/kg was also reported at 3 feet bgs. All the results are below the residential SRLs. Therefore, VOCs in soil are not considered to be Site chemicals of concern (COCs).

Metals

Soil samples were analyzed for total metals during previous investigations and the pre-design testing investigation. During previous investigations, lead was detected at concentrations above the non-residential SRL at SS-6 and SS-7 locations. These areas were subsequently excavated and sampled again, with lead concentration results below the residential SRL for lead. Borings advanced during the pre-design testing investigation at the former gas holders (near the SS-6 location) had lead results of 420 mg/kg at 2.5 feet bgs and 531 mg/kg at 7.5 feet bgs at borings B-11 and B-12, respectively, which are above the residential lead SRL. The remaining lead results were below the residential lead SRL of 400 mg/kg. Lead results at nearby borings B-13, B-24, and B-26 were below the residential SRL, indicating the lead-impacted soil was confined to the area under the former gas holders. Lead is included as a COC for the decision units (DUs) around the former gas holder areas where lead was detected above the residential SRL.

Arsenic concentrations in soil were detected above the residential and non-residential SRL of 10 mg/kg in most of the sampling results from the previous investigations and the pre-design testing investigation. In general, arsenic detections in the City area resulting from historical smelter operations are reported above the arsenic SRL (based on historical arsenic data for the City area [ATSDR, 1995]). Therefore, an evaluation of background arsenic concentrations, statistically comparing offsite and onsite concentrations at the 0 to 5, 5 to 10, 10 to 15, and 15 to 20 foot bgs intervals, was performed and is included in Section 3. Based on the statistical evaluation, onsite arsenic concentrations were similar to offsite (background) arsenic concentrations. Therefore, arsenic is not considered a COC at the Site.

This page is intentionally left blank.

3. Statistical Evaluation of Arsenic and Lead

ADEQ VRP approved the work plan for the additional investigation in September 2019 and requested APS to evaluate the background metals at the site through the use of the Gilbert Toolbox (Neptune and Company Inc., 2009) instead of a UTL95/95. The Gilbert Toolbox consists of the *t*-test, Wilcoxon rank sum test, quantile test, and slippage test. APS conducted the evaluation using the *t*-test, Wilcoxon rank sum test, and quantile test, which are discussed in this section. The slippage test has a high power for very large data sets and was not used.

The methods used to evaluate the statistical properties of metals (arsenic and lead) concentrations in soil samples collected from background and onsite at the Site also are described in this section. Lead and arsenic were included as smelter byproducts and detected at levels greater than the residential SRLs in soil samples (ATSDR, 1995). The statistical process was used to develop data sets representative of background metals concentrations. The evaluation of the data with regard to combining data sets by soil location and depth, developing descriptive summary statistics for each metal, and comparing onsite data with background are discussed in this section.

3.1 Data Conditioning

For metal/location combinations with duplicate sample results, both the parent sample and duplicate were used for statistical analyses. Although averaging parent sample and duplicate sample results may reduce sample variability, soil samples represent a point measurement with a small representative elementary volume, and based on the heterogeneous nature of the subsurface, each sample likely is a discrete result.

The concentrations of arsenic and lead were all above detectable levels with no censored observations. Estimated concentrations (concentrations denoted with the "J" qualifier) were treated as qualified detected concentrations for the purposes of statistical analysis. No data rejected through analytical data validation were identified in the data sets; therefore, no data were rejected from the data sets used for statistical evaluation.

3.2 Graphical Presentation of the Data

The data were plotted to allow for visual evaluation of the data for each metal for each sample type. Graphical presentations of the data provide insight into data sets that are not possible to visualize and understand by reviewing test statistics. The statistical plotting methods used include index plots, box-and-whisker plots, histograms, and probability plots. Graphical presentations of the data are provided in **Appendix J, Attachments J-1 through J-4**.

Box-and-whisker plots (referred to as box plots) show the central tendency, degree of symmetry, range of variation, and potential outliers of a data set. The upper value of the box represents the 75th percentile for the data and the lower value of the box is the 25th percentile for the data. Thus, 50 percent of the data fall within the box. The top of the whisker represents the 75th percentile plus 1.5 times the interquartile range (IQR), where the IQR is the 75th percentile minus the 25th percentile. The bottom of the whisker is the 25th percentile minus 1.5 times the IQR. Any value outside this range is considered a potential statistical outlier, which is represented by a dot on the plot. The outlying concentrations of box plots only serve the definition of falling relatively far from the middle 50 percent of the data. If the data are drawn from a highly skewed distribution, or a symmetrical one with long tails, multiple outliers of this type are expected.

Normal probability plots show the ordered sample results versus the corresponding quantiles of a theoretical data distribution, such as the normal distribution, and are described as a quantile-quantile, or Q-Q plot (normal Q-Q plot). Because quantiles are associated with cumulative probabilities, Q-Q plots are also referred to as probability plots. A normal probability plot is used to evaluate the normality of the distribution of a variable (that is, whether, and to what extent, the distribution of the variable follows the normal distribution). If the data are not normally distributed, they will deviate systematically from a straight

line. Variability in the data will cause the data to scatter randomly around this line, but the data will still appear to follow a single straight line. Outliers may also be evident in this plot.

A histogram is a visual representation of the data collected into groups. The data range is divided into several bins or classes and the data are sorted into the bins. A histogram is a bar graph conveying the bins and the frequency of data points in each bin. Histograms provide a visual method of accessing location, shape, and spread of the data; the shape of a histogram helps determine whether the distribution is symmetric or skewed. The visual impression of a histogram is sensitive to the number of bins selected. A large number of bins will increase data detail, while fewer bins will increase the smoothness of the histogram.

Color-coded index plots provide added insight about outliers and patterns of multiple groups potentially present in a data set. Index plots are created by plotting the concentration on the horizontal axis and the sample index number on the vertical axis, where each sample index number represents a different sample location.

3.3 Descriptive Statistics

Soil samples were collected from 25 soil boring locations (11 background borings and 14 onsite borings) at depths of up to 40 feet bgs. In this evaluation, only samples collected from depths of up to approximately 20 feet bgs were considered.

The analytical results for the soil samples are provided in **Appendix G**, with metals results listed in **Table 2-4**. Descriptive statistics for each metal are provided in **Appendix J, Table J-1** (arsenic) and **Table J-2** (lead). Statistics are provided by borehole location and include the total number of samples, number of detected results, and frequency of detection; the minimum and maximum concentrations for detected and non-detected observations; the mean, median, and standard deviation; and the distribution characteristics of each metal. These statistics also include the normality probabilities that the concentrations came from normal distributions as calculated by the Shapiro-Wilk test. When the Shapiro-Wilk probability is less than 0.05, the assumption of normality is rejected. Profiles of arsenic and lead concentrations in soil versus depth were plotted in **Appendix J, Figure J-1** to evaluate the vertical distribution of each metal in soil for each of the 25 boreholes. Different colored symbols represent the two metals.

3.4 Determination of Soil Groupings

This section discusses the evaluation of the data with regard to combining data sets by soil location and depth. Depth was defined based on 5-foot vertical intervals, using the beginning sample interval as the nominal soil sample location. This resulted in four depth intervals: 0 to 5 feet bgs; 5 to 10 feet bgs; 10 to 15 feet bgs; and 15 to 20 feet bgs. If no significant differences in background concentrations exist between soil location and depth, concentrations can be pooled together to compute the background summary statistics.

To determine whether soil locations and soil depths should be combined, analysis of variance (ANOVA) was used to establish whether significant differences exist among soil locations and soil depths. ANOVA is a technique designed to determine whether the mean values of multiple groups are statistically different from one another. Environmental data are often not normally distributed but follow skewed distributions. Thus, a nonparametric ANOVA, using the ranks of the data, as opposed to the concentrations themselves, was used for evaluating the data. Side-by-side box plots and overlapping probability plots were also used to graphically compare the concentrations of metals between the data groups. These graphical displays are provided in **Appendix J, Attachments J-2 and J-3**.

Appendix J, Table J-3 summarizes the ANOVA performed on arsenic and lead concentrations from the background data and the onsite data. This ANOVA (referred to as two-way ANOVA) studied both soil location and depth simultaneously. The calculated p-values (probabilities that the observed differences between the soil locations or depths could be due to random variability) are provided in this table. This p-value was compared to a significance level of 0.05 (the most common significance level in most statistical works), which limits the potential false conclusion that the populations are not different (when

they are) to 5 percent. If the p-value for the comparison by soil location or depth was less than 0.05, the soil locations or depths, respectively, were considered to be significantly different. Otherwise, they were determined to be statistically similar to one another.

For arsenic, there is no significant difference in background concentrations by soil depth, but concentrations are different by location (p-value of 0.018). Background concentrations of lead are significantly different by soil depth (p-value of less than 0.001) but not soil location. For comparison, concentrations of arsenic and lead in onsite soil are significantly different by both soil location (p-values of 0.012 and less than 0.001, respectively) and depth (p-values of less than 0.001). Overall, the p-values for soil depth are lower than the p-values for location in most cases, indicating that the differences between soil depth are typically more significant than the differences between locations for each group (background and onsite). However, onsite concentrations of lead appear strongly influenced by both soil location and depth.

For this reason, subsequent analysis was performed to determine which soil depth intervals are significantly different. The Kruskal-Wallis one-way ANOVA was used for this comparison. The Kruskal-Wallis test is a nonparametric method for testing whether samples from more than two groups originate from the same distribution. To determine which groups are different from the others, post-hoc testing was conducted using the Dunn test (Dunn, 1964; Zar, 2010). When performing a large number of statistical tests, some p-values less than the typical significance level of 0.05 will occur purely by chance, even if all the null hypotheses are true. Thus, the Benjamini-Hochberg procedure (Benjamini and Hochberg, 1995) was used to control the family-wise error rate in the pairwise comparisons.

Appendix J, Table J-4 summarizes the results of the Kruskal-Wallis test. Similar to the two-way ANOVA results, there is no significant difference in background arsenic concentrations by soil depth. Background lead concentrations appear to be higher in the 0- to 5-foot depth interval compared to deeper soil depths. For Site soil, arsenic and lead concentrations appear to be higher in the 0- to 5-foot and the 5- to 10-foot depth intervals.

3.5 Onsite Concentration to Background Comparisons

Tests of central tendency (two-sample hypothesis tests) were performed to determine with statistical confidence whether arsenic and lead concentrations in each onsite soil depth interval are different, on average, from background concentrations.

The appropriate type of central tendency comparison test was determined based on the statistical distribution of the two data sets being tested. For cases where both data sets appear to be normally distributed, a *t*-test was performed to determine whether the means of the two populations appear to be different from one another. The specific form of *t*-test (Student's *t*-test or Welch's *t*-test) was determined based upon whether the variances of the data sets could be considered equal. If the distributions of the data sets did not coincide or if they were both nonparametric, then the nonparametric Wilcoxon Rank Sum test was used for comparison of central tendency. This is a nonparametric version of a two-sample *t*-test and calculates whether the medians of the two distributions are different or similar. Because the nonparametric Wilcoxon Rank Sum test assumes equal variance, when this assumption was not satisfied, the data were compared using the two-sample Kolmogorov-Smirnov test. The two-sample Kolmogorov-Smirnov test is a nonparametric method that compares the cumulative distributions of two data sets.

Because the nature of the potential impact at the Site is unknown, the quantile test was used in conjunction with the central tendency test. This test focuses on comparing the right tails of the Site and background distributions instead of comparing the medians or means of the two distributions. The quantile test is appropriate to address localized impacts compared to site-wide impacts. The quantile test was performed using the 80th percentile.

To supplement the formal statistical comparisons, overlapping probability plots comparing the quantiles of the background and site-specific data against each other are provided in **Appendix J, Attachment J-4**. This attachment also includes stacked histograms and side-by-side box plots comparing background and

site-specific data for each metal. **Appendix J, Table J-5** presents results of the central tendency and quantile tests conducted by soil depth for each metal.

Comparisons were performed using a common null hypothesis that concentrations of arsenic or lead in the onsite sample population are less than or equal to background concentration levels. The tests were conducted using a significance level of 0.05 (corresponding to a 95% confidence level). If the calculated probability (p-value) from a test is below 0.05, a conclusion is drawn to reject the null hypothesis and, instead, determine that a significant test result exists. In these tests, a p-value is calculated that is essentially the probability that the observed differences between the centers of the two sample sets occurred merely due to random variability in the data, or whether those differences are an indication that the center of the Site population is greater than background.

Based on a comparison of onsite and offsite statistical results detailed in the sections above, onsite concentrations appear to be consistent with background concentrations.

4. Human Health Risk Assessment

An HHRA was completed to assess the current and potential future cancer risks and noncancer hazards associated with exposures to surface and subsurface soil (0 to 15 feet bgs), deep soil (> 15 feet bgs), and groundwater at the Site to support remedial action decisions for the Site. Risks are estimated for residential and commercial/industrial (non-residential) exposure scenarios for soil and a residential exposure scenario for groundwater to reflect possible future site uses.

4.1 Human Health Risk Assessment Approach

For purposes of this risk assessment and to support risk management decision making, potential onsite receptors are assumed to be exposed to HHRA chemicals of potential concern (COPCs) in soil and groundwater under current and potential future land use conditions. The Site has been owned by the City since 1987 and is crossed by an El Paso Natural Gas easement. As described in Section 1, an IRA was conducted in 1996 to remove the majority of the impacted surface soil. Although the City does not use the property, construction debris consisting of soil, gravel, asphalt, and concrete has been dumped on the property. Prior to the 2019 site investigation activities, the City removed the dumped construction debris from the Site. The compounds potentially related to the former MGP operations and existing subsurface features have impacted the soil at the Site were evaluated during the 2019 pre-design testing investigation. Therefore, the exposure scenarios in this HHRA assume that a final remediation action has not been completed, and no institutional controls (ICs) have been implemented.

Standard-of-practice risk assessment methods and default exposure assumptions were used in the HHRA to develop exposure scenarios for the Site. The HHRA was performed in accordance with ADEQ risk assessment protocols (ADEQ, 2009, 2018), ADHS's *Deterministic Risk Assessment Guidance* (ADHS, 2003), EPA risk assessment guidance (Risk Assessment Guidance for Superfund Parts A, B, C, E, and F; EPA, 1989, 1991a, 1991b, 2004, 2009), and ASTM Risk-Based Corrective Action Guidance (ASTM, 1998).

The following four steps of the risk assessment are discussed in this section:

1. Data evaluation
2. Exposure assessment
3. Toxicity assessment
4. Risk characterization

4.1.1 Step 1: Data Evaluation

In the first risk assessment step, an HHRA data set of soil sampling results was compiled for each depth group: surface and subsurface soil (0 to 15 feet bgs) and deep soil (> 15 feet bgs). Soil samples for each depth group were evaluated separately for onsite and background (offsite) areas.

Analytical data collected during the pre-design testing investigation in 2019 at the Site were used in the HHRA. The soil and groundwater sample locations included in the analytical data set are presented on **Figure 2-2**. A list of soil and groundwater samples used in this HHRA is presented in **Tables K-1** and **K-2** in **Appendix K**. Analytical results for soil and groundwater samples collected from these locations are provided in **Attachments 1** through **5** in **Appendix K**. Due to previous interim remediation efforts and changing site conditions over the last 20 years, soil samples from historical investigations were not considered representative of current conditions and, therefore, not used in this HHRA. Pre-design investigation samples for soil and groundwater were analyzed for PAHs, metals, and VOCs. All detected analytes from the pre-design testing investigation in 2019 that are potentially associated with former MGP operations (i.e., PAHs, petroleum VOCs, and lead) were selected as COPCs in this HHRA for quantitative risk estimate calculations.

Following EPA risk assessment guidance, the concentrations for the seven carcinogenic PAHs (benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene,

dibenz(a,h)anthracene, and indeno(1,2,3-cd)pyrene) were converted to a benzo(a)pyrene toxic equivalence quotient (BAP TEQ) using the relative potency factors (RPFs) presented in *Provisional Guidance for Quantitative Risk Assessment of Polycyclic Aromatic Hydrocarbons* (EPA, 1993) and Section 2.3.6 of the EPA Regional Screening Levels (RSLs) User's Guide (EPA, 2019a) and the following equation:

$$BAP\ TEQ = ([PAH_i] \times RPF_i) + \dots + ([PAH_{vii}] \times RPF_{vii})$$

Where:

BAP TEQ = benzo(a)pyrene toxic equivalent concentration (mg/kg)

PAH_i = PAH concentration for each of the seven carcinogenic PAHs (mg/kg)

RPF_i = relative potency factor for each carcinogenic PAH (dimensionless)

Both detected and non-detected results were included in the BAP TEQ calculations. For non-detected concentrations, one-half the RL was used as a proxy value in the calculation (i.e., BAP TEQ [ND = ½*RL]). This is a conservative approach for addressing the non-detected concentrations for this screening evaluation. Therefore, to support risk management decision making, the BAP TEQ was also calculated with non-detected results set to zero (i.e., BAP TEQ [ND = 0]).

Attachments 6 and 7 in Appendix K present the BAP TEQ concentrations calculated for Site surface and subsurface soil (0 to 15 feet bgs) and **Attachments 8 and 9 in Appendix K** present the BAP TEQ concentrations calculated for deep soil (> 15 feet bgs).

Because it is unlikely that receptors would be exposed to the maximum detected soil concentrations at the Site given that the majority of impacts are in the subsurface and construction debris covering the surface, the COPCs were further evaluated using statistically derived exposure point concentrations (EPCs), which were identified based on measured COPC concentrations in surface and subsurface soil and in deep soil.

ProUCL Version 5.1.002 (EPA, 2015, 2016) was used to calculate the upper confidence limit (UCL) of the mean concentration for each COPC that had a maximum detected concentration exceeding EPA RSLs for residential and industrial direct contact exposure to soil or groundwater (EPA, 2019b). The RSLs used for the HHRA are based on a target excess lifetime cancer risk (ELCR) of 1×10^{-5} and a target hazard quotient (HQ) of 1. For the COPCs for which 95-UCLs were calculated, the lower of maximum detected concentration and 95-UCL was used as the EPC. **Tables K-3 and K-4 in Appendix K** provide the comparisons of Site surface and subsurface soil (0 to 15 feet bgs) maximum detected concentrations and EPCs to the residential and industrial soil RSLs for onsite and background (offsite) areas, respectively. **Tables K-5 and K-6 in Appendix K** provide the comparisons of Site deep soil (> 15 feet bgs) maximum detected concentrations and EPCs to the residential and industrial soil RSLs for onsite and background (offsite) areas, respectively. **Table K-7 in Appendix K** provides the comparisons of Site groundwater maximum detected concentrations and EPCs to the residential tap water RSLs (EPA, 2019b).

The ProUCL outputs for COPCs in surface and subsurface soil (0 to 15 feet bgs) and deep soil (> 15 feet bgs) are provided in **Attachments 10 through 13 in Appendix K**.

Cyanide was included in pre-design testing waste characterization from 16 soil boring locations. Risk calculations for cyanide are provided in **Attachment 14 in Appendix K**.

4.1.2 Step 2: Exposure Assessment

In the second risk assessment step of the HHRA, the following exposure scenarios were evaluated:

- **Industrial Worker Exposure Scenario:** An occupational scenario for current and possible future industrial use of the Site considers potential exposure to surface and subsurface soil (0 to 15 feet bgs) during general utility and construction activities and deep soil (> 15 feet bgs) during atypical construction/excavation activity. However, during routine use of the Site, potential exposure is

expected to be limited to surface soil (0 to 2 feet bgs). As discussed previously, this exposure scenario is considered potentially complete for the Site and is included in the quantitative risk characterization step (Step 4); however, potential exposure under current land use conditions is limited.

- **Construction Worker Exposure Scenario:** A construction scenario considers current and future onsite construction/utility workers engaged in excavation activities who are potentially exposed to surface and subsurface soil (0 to 15 feet bgs) and deep soil (> 15 feet bgs). However, since the industrial exposure workers' exposure assumptions are more conservative than a construction worker scenario, the industrial worker exposure scenario was considered protective of construction workers for this HHRA. Therefore, construction worker exposure scenario was not evaluated in the risk characterization step separately from the industrial worker exposure scenario.
- **Residential Exposure Scenario:** There is no historical or current use of the Site as residential. A possible hypothetical future use of the Site for residential scenario and possible use of the Site for groundwater supply well were evaluated. Although residential exposures are unlikely at the Site, it was evaluated to provide a conservative assessment of potential risk. This scenario conservatively considers exposure to surface and subsurface soil (0 to 15 feet bgs) during household activities. During routine household activities, potential exposure is expected to be limited to surface soil (0 to 2 feet bgs). In addition, deep soil (> 15 feet bgs) exposure is evaluated. However, it is rare that deep soil (> 15 feet bgs) will be brought to the surface.
- **Trespasser or Recreational Exposure Scenario:** The soil exposure pathways for the trespasser or recreational exposure scenarios are also considered potentially complete; however, because of the limited time spent on the Site and the limited amount of exposed soil at the Site, the magnitude of exposure will be considerably less than for the industrial, residential, and construction exposure scenarios. In addition, the Site is a secure facility and public access is prohibited. Therefore, a trespasser exposure scenario was not evaluated in the risk characterization step separately from the industrial worker or residential exposure scenarios.

The following three soil exposure pathways were identified as potentially complete for residential and industrial receptors:

- Incidental ingestion of surface, subsurface, and deep soil.
- Dermal contact with surface, subsurface, and deep soil.
- Inhalation of volatiles and airborne particulates (surface, subsurface and deep soil entrained by wind or mechanical action).

The following three groundwater exposure pathways were identified as potentially complete for residential receptors:

- Incidental ingestion of groundwater as tap water.
- Dermal contact with groundwater as tap water during household activities.
- Inhalation of volatiles during household activities such as showering.

4.1.3 Step 3: Toxicity Assessment

In the toxicity assessment step of the HHRA, the potential adverse health effects associated with the HHRA COPCs are summarized and appropriate EPA toxicity values are identified. These toxicity values are embedded in the EPA RSLs (EPA, 2019a, 2019b). For COPCs without published RSLs, surrogate chemicals were assigned as follows:

- Acenaphthene for acenaphthylene
- Pyrene for benzo(g,h,i)perylene
- Anthracene for phenanthrene
- m-Xylene for m,p-xylenes

As described in Section 4.1.1, carcinogenic PAHs were evaluated as BAP TEQ in risk calculations. However, an updated toxicological review of benzo(a)pyrene (EPA, 2017) indicates that exposures to this chemical could result in adverse effects not related to cancer. Therefore, the unadjusted benzo(a)pyrene sample data (i.e., not BAP TEQ) were also evaluated for noncancer effects.

Lead is a probable carcinogen in humans and has multiple toxic effects on the human body, such as decreased intelligence in children and increased blood pressure in adults. However, no toxicity reference values are available for lead. Therefore, lead was evaluated by comparing its concentrations with EPA RSLs of 400 mg/kg and 800 mg/kg under residential and industrial scenario, respectively.

4.1.4 Step 4: Risk Characterization

The information from the first three steps was integrated in the risk characterization step. Numerical estimates were identified for potential cancer and non-cancer risks, and the uncertainties associated with the risk estimates were summarized. EPA uses the general range of 1×10^{-6} to 1×10^{-4} as a “target range” for total ELCR estimate within which the agency strives to manage risks (EPA, 1989). EPA states that action should be taken to address risks above 1×10^{-4} and may be taken to address risks between 1×10^{-4} and 1×10^{-6} to reduce any potential exposure (EPA, 1991a). In addition, EPA uses a total hazard index (HI) greater than 1 as an indication that there may be a concern for adverse noncancer health effects. The cancer risks and noncancer hazards were calculated using the methods described below.

4.1.4.1 Carcinogenic Risk Estimation

The potential for carcinogenic effects associated with exposure to the COPCs was evaluated by estimating the ELCR. ELCR is the incremental increase in the probability of developing cancer during one’s lifetime in addition to the background probability of developing cancer. For example, an individual exposed to a carcinogen with a calculated cancer risk of 2×10^{-6} indicates the probability of the individual getting cancer increases by 2 out of 1 million compared to background levels.

Chemical-specific ELCRs were calculated using a risk ratio approach (EPA, 1991b). For chemicals identified as COPCs based on the comparison of the statistically derived concentration to the RSL, chemical-specific ELCRs were calculated for each identified using the following equation:

$$ELCR = \frac{\text{Soil EPC (mg/kg)} \times TR (1 \times 10^{-5})}{\text{Soil RSL (mg/kg)}}$$

Where:

ELCR = excess lifetime carcinogenic risk estimate (dimensionless)

EPC = exposure point concentration (mg/kg)

TR = target risk level

RSL = regional screening level – cancer effects (mg/kg) (EPA, 2019a, 2019b)

The RSLs used to identify the potential for unacceptable carcinogenic effects were based on a target risk of 1×10^{-5} . The ELCR results from multiple chemicals are summed to a total ELCR.

4.1.4.2 Noncancer Hazard Estimation

For noncancer effects, the potential for a receptor to develop an adverse effect was estimated by comparing the predicted level of exposure for a particular chemical with the highest level of exposure that is considered protective (i.e., the screening level). For chemicals identified as COPCs, a corresponding HQ was calculated using the following equation:

$$HQ = \frac{\text{Soil EPC (mg/kg)} \times \text{Target Hazard (1)}}{\text{Soil RSL (mg/kg)}} \quad (1)$$

Where:

HQ = hazard quotient

EPC = exposure point concentration

RSL = regional screening level – noncancer effects (EPA, 2019a, 2019b)

mg/kg = milligram(s) per kilogram

The HQ results from multiple chemicals are summed to a HI. The RSLs used to identify the potential for unacceptable noncarcinogenic effects were based on a target HQ of 1.

4.1.4.3 Identification of Chemicals of Concern

For this HHRA, compounds were identified as COCs if the total ELCR was greater than 1×10^{-5} and the HI was greater than 1.

4.2 Risk Characterization Results

Risk estimates are provided in **Tables K-8 through K-12 in Appendix K** for surface and subsurface soil, deep soil, and groundwater. The risk estimates were calculated using EPCs based on maximum concentrations or 95-UCLs. However, in this HHRA, surface and subsurface soil and deep soil EPCs are generally identified as based on maximum concentrations, and for groundwater, all EPCs are based on maximum concentrations. Therefore, the risk estimates calculated using maximum concentrations are highly conservative.

4.2.1 Industrial Exposure Scenario

4.2.1.1 Onsite Soil

The onsite industrial risk estimates are presented in **Tables K-8 and K-10 in Appendix K** for surface and subsurface soil, and deep soil, respectively.

For surface and subsurface soil (0 to 15 feet bgs), the total ELCR at the Site is 2×10^{-5} when the BAP TEQ is based on $ND = \frac{1}{2} \times RSL$, which is within the EPA target risk range ($TR = 1 \times 10^{-6}$ to 1×10^{-4}) (**Table K-8 in Appendix K**). The noncancer HI is 0.2, which is less than the target HQ of 1. The primary contributors to the cancer risk are arsenic, chromium, BAP TEQ, and naphthalene.

For deep soil (> 15 feet bgs), the total ELCR (when BAP TEQ is based on $ND = \frac{1}{2} \times RSL$) is 1×10^{-5} , which is within the EPA target risk range ($TR = 1 \times 10^{-6}$ to 1×10^{-4}) (**Table K-10 in Appendix K**). The noncancer HI is 0.07, which is less than the target HQ of 1. The primary contributors to the cancer risk are arsenic and chromium.

The EPC for lead does not exceed the industrial RSL of 800 mg/kg in surface and subsurface soil (0 to 15 feet bgs) and deep soil (> 15 feet bgs). None of the detected concentrations of lead exceed the industrial soil RSL.

Based on background risk estimates (Section 4.2.1.2) and the statistical comparison (Section 3), arsenic is not considered site related in deep soil. Industrial risks in surface and subsurface soil (0 to 15 feet bgs) for arsenic onsite ($6.2E-06$, **Table K-8 in Appendix K**) and offsite (background) soil ($5.3E-06$, **Table K-9 in Appendix K**) are similar. Industrial risks in deep soil (> 15 feet bgs) for arsenic in onsite soil ($5.6E-06$, **Table K-10 in Appendix K**) and offsite (background) soil ($6.0E-06$, **Table K-11 in Appendix K**) are also similar. The statistical comparison shows arsenic above background for the 5- to 10-foot-bgs interval only.

For chromium, risks were calculated using conservative toxicity values of hexavalent chromium (i.e., 100 percent of the chromium in soil is considered to be in the hexavalent form). Chromium in soil is generally in trivalent form. Trivalent chromium and total chromium do not have cancer toxicity values (EPA, 2019b). None of the maximum detected concentrations of total chromium exceed the trivalent chromium soil RSL.

for an industrial exposure scenario. Based on background risks and a toxicity assumption founded on a highly conservative surrogate, chromium is not considered site related in surface, subsurface, or deep soil.

4.2.1.2 Background Soil (Offsite)

The background (offsite) industrial risk estimates are presented in **Tables K-4 and K-6 in Appendix K** for surface and subsurface soil, and deep soil, respectively.

For surface and subsurface soil (0 to 15 feet bgs), the total ELCR (when BAP TEQ is based on $ND = \frac{1}{2} \times RL$) at the Site is 7×10^{-6} , which is within the EPA target risk range ($TR = 1 \times 10^{-6}$ to 1×10^{-4}) (**Table K-9 in Appendix K**). The noncancer HI is 0.05, which is less than the target HQ of 1. The primary contributors to the cancer risk are arsenic and chromium.

For deep soil (> 15 feet bgs), the total ELCR (when BAP TEQ is based on $ND = \frac{1}{2} \times RL$) is 1×10^{-5} , which is within the EPA target risk range ($TR = 1 \times 10^{-6}$ to 1×10^{-4}) (**Table K-11 in Appendix K**). The noncancer HI is 0.05, which is less than the target HQ of 1. The primary contributors to the cancer risk are arsenic and chromium.

The EPC for lead does not exceed the industrial RSL of 800 mg/kg in surface and subsurface soil (0 to 15 feet bgs) or deep soil (> 15 feet bgs).

Table K-12 in Appendix K shows the cancer risk and noncancer HI estimates without the non-site-related chemicals (arsenic in deep soil and chromium in surface and subsurface soil and deep soil).

4.2.3 Residential Exposure Scenario

4.2.3.1 Onsite Soil

The onsite residential risk estimates are presented in **Tables K-3 and K-5 in Appendix K** for surface and subsurface soil, and deep soil, respectively.

For surface and subsurface soil (0 to 15 feet bgs), the total ELCR (when BAP TEQ is based on $ND = \frac{1}{2} \times RL$) is 2×10^{-4} , which is above the EPA target risk range ($TR = 1 \times 10^{-6}$ to 1×10^{-4}) (**Table K-8 in Appendix K**). The noncancer HI is 2, which is above the target HQ of 1. The primary contributors to the cancer risk are arsenic, chromium, BAP TEQ, and naphthalene. There are no primary contributors to the hazard as none of the individual analytes has an HQ greater than 1.

For deep soil (> 15 feet bgs), the total ELCR (when BAP TEQ is based on $ND = \frac{1}{2} \times RL$) is 1×10^{-4} , which is at the higher end of the EPA target risk range ($TR = 1 \times 10^{-6}$ to 1×10^{-4}) (**Table K-10 in Appendix K**). The noncancer HI is 0.9, which is less than the target HQ of 1. The primary contributors to the cancer risk are arsenic, chromium, and BAP TEQ.

Based on background risk estimates (Section 4.2.3.2) and the statistical comparison (Section 3), arsenic is not considered site related in soil from 0 to 5 feet bgs or in deep soil (> 15 feet bgs). Residential risks in surface and subsurface soil (0 to 15 feet bgs) for arsenic onsite ($2.7E-05$, **Table K-8 in Appendix K**) and offsite (background) soil ($2.3E-05$, **Table K-9 in Appendix K**) are similar. Residential risks in deep soil (> 15 feet bgs) for arsenic in onsite soil ($2.5E-05$, **Table K-10 in Appendix K**) and offsite (background) soil ($2.6E-05$, **Table K-11 in Appendix K**) are also similar. The statistical comparison shows onsite arsenic concentrations were similar to offsite (background) arsenic concentrations.

For chromium, risks were calculated using conservative toxicity values of hexavalent chromium (i.e., 100 percent of the chromium in soil is considered to be in the hexavalent form). Chromium in soil is generally in trivalent form. Trivalent chromium and total chromium do not have cancer toxicity values (EPA, 2019b). None of the maximum detected concentrations of total chromium exceed the trivalent chromium soil RSL for a residential exposure scenario. Based on background risk estimates and a toxicity assumption

founded on a highly conservative surrogate, chromium is not considered site related in surface, subsurface, or deep soil.

The EPC for lead does not exceed the residential RSL of 400 mg/kg in surface and subsurface soil (0 to 15 feet bgs) or deep soil (> 15 feet bgs). Two of the 73 surface and subsurface soil concentrations exceed the residential soil RSL of 400 mg/kg: 420 mg/kg in D-B11-2.5-3.0 and 531 mg/kg in D-B12-7.7-8.0. None of the lead concentrations in deep soil exceed the industrial soil RSL.

Cyanide was included in pre-design testing waste characterization from 16 soil boring locations and one composite soil sample (**Attachment 14** in **Appendix K**). The calculated residential HQ for cyanide in 0 to 15 feet bgs soil is 0.03.

4.2.3.2 Background Soil (Offsite)

The background (offsite) residential risk estimates are presented in **Tables K-9** and **K-11** in **Appendix K** for surface and subsurface soil, and deep soil, respectively.

For surface and subsurface soil (0 to 15 feet bgs), the total ELCR (when BAP TEQ is based on $ND = \frac{1}{2} \times RL$) is 7×10^{-5} , which is within the EPA target risk range ($TR = 1 \times 10^{-6}$ to 1×10^{-4}) (**Table K-9** in **Appendix K**). The noncancer HI is 0.7, which is above the target HQ of 1. The primary contributors to the cancer risk are arsenic, chromium, and BAP TEQ.

For deep soil (> 15 feet bgs), the total ELCR (when BAP TEQ is based on $ND = \frac{1}{2} \times RL$) is 1×10^{-4} , which is at the higher end of the EPA target risk range ($TR = 1 \times 10^{-6}$ to 1×10^{-4}) (**Table K-11** in **Appendix K**). The noncancer HI is 0.7, which is less than the target HQ of 1. The primary contributors to the cancer risk are arsenic, chromium, and BAP TEQ.

The EPC for lead does not exceed the residential RSL of 400 mg/kg in surface and subsurface soil (0 to 15 feet bgs) and deep soil (> 15 feet bgs).

4.2.3.3 Groundwater

The residential risk estimates are presented in **Table K-12** in **Appendix K** for groundwater. For groundwater, the total ELCR is 3×10^{-7} when the BAP TEQ is based $ND = \frac{1}{2} \times RL$, which is below the EPA target risk range ($TR = 1 \times 10^{-6}$ to 1×10^{-4}) (**Table K-12** in **Appendix K**). The noncancer HI is 0.03, which is above the target HQ of 1.

4.3 Summary

The HHRA used the available soil data, standard-of-practice risk assessment methods, and default exposure assumptions to develop exposure scenarios for the Site. The City owns the property but does not use it. However, construction debris consisting of soil, gravel, asphalt, and concrete has been dumped on the property. Prior to the 2019 site investigation activities, the City removed the dumped construction debris from the Site. The compounds potentially related to the former MGP operations and existing subsurface features have impacted the soil at the Site. Therefore, the exposure scenarios in this HHRA assume that no remedial action has been completed and no ICs have been implemented. Prior to the 2019 site investigation, construction debris piles covered the Site, preventing exposure. Once the debris was removed during the 2019 site investigation, the Site was secured by a fence. The Site security fence will remain in place until the remedial action is completed.

A summary of the estimated cancer risks and noncancer hazards for exposure to surface and subsurface soil (0 to 15 feet bgs) and deep soil (> 15 feet bgs) under industrial and residential scenarios is presented in **Table K-13** in **Appendix K**. For surface and subsurface soil (0 to 15 feet bgs) under the industrial scenario, risks are within the EPA acceptable cancer risk range of 1×10^{-6} to 1×10^{-4} and noncancer HI is below the target of 1. For the residential scenario, risks are above the EPA acceptable cancer risk range of 1×10^{-6} to 1×10^{-4} and noncancer HI is above the target HI of 1; however, there is no access or exposure to the soil currently.

For deep soil (> 15 feet bgs), the exposure scenarios evaluated are within, or at the higher end of, the EPA acceptable cancer risk range of 1×10^{-6} to 1×10^{-4} . Estimated noncancer HIs are below the target HI of 1.

For groundwater, the exposure scenario evaluated is below the EPA acceptable cancer risk range of 1×10^{-6} to 1×10^{-4} . Estimated noncancer HI is below the target HI of 1.

The HHRA COCs are the COPCs that contribute to the majority of the cancer risk and noncancer hazard estimates or result in individual cancer risk estimates greater than 1×10^{-5} or a hazard estimate greater than 1 in surface and subsurface soil (0 to 15 feet bgs) (**Table K-14** in **Appendix K**).

Based on the industrial exposure scenario risk characterization results, arsenic (in soil from 5 to 10 feet bgs only), BAP TEQ, and naphthalene were identified as HHRA COCs in surface and subsurface soil (0 to 15 feet bgs). Based on the residential exposure scenario risk characterization results, arsenic (5 to 10 feet bgs only), BAP TEQ, and naphthalene were identified as HHRA COCs in surface and subsurface soil (0 to 15 feet bgs). Arsenic is not considered an HHRA COC in soil from 0 to 5 feet bgs due to the statistical comparison showing arsenic is similar to background within the 0 to 5 feet bgs soil interval.

No COCs were identified in deep soil (> 15 feet bgs) for the industrial or residential scenarios.

5. Groundwater Protection Level Modeling – Potential Threat to Groundwater from Soil Contaminants

This section presents the procedure and results of using ADEQ's GPL screening method presented in *A Screening Method to Determine Soil Concentrations Protective of Groundwater Quality* (ADEQ, 1996) and *GPL Spreadsheet* (ADEQ, 2013) to determine if residual contaminant concentrations left in place could cause or threaten to cause contamination of groundwater. Data indicate that the vadose zone is composed of unconsolidated alluvium, which is consistent with the approach used by ADEQ (1996, 2013). The depth to groundwater at the Site is about 26 feet based on results from recent site investigation activities.

5.1 Applicable Cleanup Standards

ADEQ has established the following types of predetermined soil cleanup standards:

- SRLs are soil concentrations that are protective of human health, either under residential or non-residential exposure scenarios. A.A.C. R18-7-203(B)(1) allows the use of a pre-determined SRL only if that remediation level is also protective of groundwater.
- Minimum GPLs represent soil concentrations protective of groundwater quality. The minimum GPLs were developed by ADEQ (1996, 2013) to represent a theoretical worst-case scenario in which soil is assumed to be contaminated from surface to groundwater.

In addition to these soil cleanup standards, ADEQ's GPL one-dimensional model for vadose zone contaminant fate and transport can be used to calculate an alternate, site-specific GPL. This is achieved by inputting Site-specific characteristics that impact fate and transport, such as depth to water, depth of detectable contamination, soil porosity, and fraction of organic carbon in soil, along with chemical-specific physical properties such as solubility and ability to adsorb to organic materials in the soil. The process for calculating alternate GPLs for metals is slightly different (ADEQ, 1996). This model was used to calculate GPLs for selected compounds as described in the following sections. The GPLs (minimum GPLs or calculated GPLs) were compared to the residential SRLs and the lowest applicable soil regulatory standard was selected as the applicable cleanup standard for the Site.

A compound must have a water quality standard in order to have a GPL. Typically, the AWQS is used as the water quality standard. However, EPA and ADEQ have also established risk-based standards for compounds that do not have an AWQS (ADEQ, 1996, 2013), as is the case for most PAHs. To comprehensively assess the potential for contaminants in soil to impact groundwater, detected compounds with a risk-based standard, in addition to those compounds with an AWQS, were also modeled.

5.2 Selection of Modeled Contaminants

Section 1.3.1 presents a comparison of historical soil sampling results to SRLs, and **Section 2.4.2** presents a comparison of 2019 soil sampling results at the Site to SRLs. This section evaluates soil sampling results compared to GPLs. As discussed in **Section 1.4**, historical surface soil results were not used in evaluating current site impacts due to previous remediation activities at the Site. Historical subsurface results and 2019 surface and subsurface results were used in this evaluation.

Tables 1-2 and **2-3** present the PAH results in soil at the Site based on previous and pre-design testing investigations. Minimum GPLs are not listed in ADEQ (2013), and Jacobs modeled the 14 PAHs that were detected in subsurface soil samples and have established AWQS or Arizona risk-based standards. Benzo(g,h,i)perylene and phenanthrene do not meet these criteria and were not modeled.

Table 1-3 summarizes historical TPH results in soil at the Site. There is no AWQS or other risk-based standard in Arizona for TPH in groundwater, and GPL modeling was not conducted for TPH.

Table 1-4 summarizes historical BTEX at the Site, and **Table 2-5** presents VOC results in soil at the Site. No compounds were detected at concentrations exceeding their minimum GPLs (ADEQ, 2013), if established and GPL modeling was not conducted for VOCs.

Tables 1-5 and **2-4** summarize metals results in soil at the Site. The only compound detected at a concentration exceeding its minimum GPL (ADEQ, 1996) in the subsurface soil samples was lead. An alternative GPL was calculated for lead in subsurface soil samples.

5.3 Alternate GPL Development

5.3.1 Polynuclear Aromatic Hydrocarbons

The ADEQ (2013) spreadsheet model was used to calculate minimum GPLs for the following PAHs:

- Acenaphthene
- Acenaphthylene
- Anthracene
- Benzo(a)anthracene
- Benzo(a)pyrene
- Benzo(b)fluoranthene
- Benzo(k)fluoranthene
- Chrysene
- Dibenzo(a,h)anthracene
- Fluoranthene
- Fluorene
- Indeno(1,2,3-cd)pyrene
- Naphthalene
- Pyrene

A combination of model default values, chemical-specific values, and site-specific values were used to calculate minimum GPLs for these compounds at the Site. Copies of the modeling spreadsheet for each compound, including the sources of the values used, are included in **Appendix L**. GPL modeling output values are shown on the GPL tab of the model spreadsheet. The ADEQ model does not display results greater than 11 digits, over 1 billion mg/kg, and some results cannot be displayed by the GPL model. GPL results are listed in **Table 5-1**.

Unless otherwise specified, model default values were used. Examples include the release width and soil porosity. Although biodegradation of petroleum hydrocarbons in soil and groundwater is expected, the half-life of 100,000 days, indicating a very low biodegradation rate, was used because PAHs are not as readily degradable as volatile compounds. The default time step of 10 days was used except in some instances where it was adjusted so that the peak liquid phase concentration was clearly visible on the Jury1 Output graph.

Chemical-specific values include the water quality standard or risk-based standard, octanol-water partitioning coefficient, Henry's constant, and solubility. For most of the modeled compounds, these values were obtained from the lookup table in ADEQ (2013). When these values were not available in that source, they were obtained from other sources such as ADEQ (1992), EPA (2019) and the New Jersey Department of Environmental Protection (2019).

Site-specific values include the depth to groundwater, dry bulk density, foc, and moisture content. The depth to groundwater was assumed to be 26.48 feet bgs, which was the minimum depth to water measured in boreholes during the 2019 investigation. This value, converted to 807 centimeters, was also used for the depth of incorporation and the total vadose zone depth. Analytical and geotechnical data from the Site investigation, summarized in **Table 2-2**, were used for the other values. The average dry bulk density was 94.5 pounds per ft³, or 1.51 grams per cubic centimeter. The average foc was 1.9 percent. The average water content, not including two values that were obtained from beneath the water table, was 9.9 percent.

Table 4-1 summarizes the modeling results.

Based on modeling results for anthracene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenz(a,h)anthracene, fluoranthene, fluorene, and pyrene, the calculated GPLs were greater than 1.0×10^6 mg/kg (also equal to 1 kg/kg), which exceeds unity. This means that the mass of the contaminant present in the soil would need to exceed the total mass of soil, which is not possible. A GPL could not be calculated for indeno(1,2,3 c,d)pyrene because the model-estimated maximum soil concentration was too low, resulting in attempted division by zero.

The calculated GPLs for acenaphthene (90,300 mg/kg), acenaphthylene (29,100 mg/kg) and naphthalene (113 mg/kg) provide potential cleanup standards for these compounds. None of the PAH concentrations reported in **Table 2-3** exceeded the calculated GPLs.

5.3.2 Metals

ADEQ (1996) describes the method for calculating an alternative GPL for metals. This method uses the ratio between the total metal concentration in soil to the concentration of the metal in the leachate from a TCLP or SPLP procedure. The calculation is (ADEQ, 1996):

$$X = 292.9 \times R \times C_w$$

Where:

- X is the alternative GPL
- R is the ratio of the total metal concentration in soil to the concentration in leachate
- C_w is the maximum allowable groundwater concentration (in this case, the AWQS of 0.05 mg/L)

TCLP analysis was conducted on the two soil samples that exceeded the minimum GPL.

Sample D-B11-2.5-3.0 contained lead at a concentration of 420 mg/kg, and the TCLP leachate contained 0.128 mg/L of lead, resulting in a ratio of 3,280. Sample D-B12-7.5-8.0 contained lead at a concentration of 531 mg/kg, and the TCLP leachate contained 0.92 mg/L of lead, resulting in a ratio of 577. To develop a conservative GPL, the lower ratio was used, and the calculation became:

$$X = 292.9 \times 577 \times 0.05$$

The resulting alternative GPL for lead in Site soil is 8,450 mg/kg. None of the measured concentrations exceeded this value.

This page is intentionally left blank.

6. Feasibility Screening

The site-specific RAOs and the screening and evaluation processes for remediation of soil that is protective of human health and groundwater at the Site are described in this section. Remediation options are screened based on site-specific factors to eliminate technologies that constrain effectiveness, implementability, or cost-effectiveness at the Site and streamline the evaluation process for the technologies retained for a detailed evaluation.

6.1 Remedial Action Objectives

The objectives of this remedial action are to reduce concentrations of COCs, primarily PAHs, and lead in soil to levels below appropriate risk-based cleanup criteria and to remove source material that may potentially impact the groundwater to the extent technically feasible. Site-specific cleanup criteria to achieve the RAOs are discussed in Section 7.2. The Site will be remediated so that concentrations remaining in the soil are protective of human health and the environment.

The following RAOs are based on specific constituents, potential exposure, and future Site uses:

- Reduce the concentration of COCs in soil to below regulatory risk-based levels (residential SRLs) where feasible.
- Reduce the concentration of COCs in soil to below levels that could potentially impact groundwater above water quality standards.

6.2 Remediation Technology Screening

To meet the site-specific RAOs, a range of remediation options was considered for the Site.

6.2.1 No Action

The no action response is considered during the development and analysis of alternatives as the baseline against which other technologies are evaluated. The no action response does not provide any additional remediation, containment, or security measures to reduce the potential risk to human health or the environment at the Site.

6.2.2 Institutional Controls

ICs are restrictive measures placed on the use of the Site to prevent or limit exposure to hazardous substances left in place at the Site. Typically, ICs are implemented as engineering and/or legal controls that are often used in conjunction with active remediation activities, such as treatment or containment. Often, it is necessary to implement multiple ICs to provide overlapping assurances of protection of future receptors. ICs result in restrictions that effectively limit the manner in which the Site can be used in the future.

6.2.3 Ex Situ Response Actions

Ex situ response actions for MGP sites consist of the removal of impacted soil followed by treatment and/or disposal. For impacted soil, the response includes excavation of the impacted soil. The excavated soil is disposed of offsite at a permitted facility or can be treated onsite or offsite using enhanced biological or thermal treatment technologies.

6.2.4 In Situ Response Actions

The in situ response actions considered for the Site are described in this section.

6.2.4.1 Monitored Natural Attenuation

The monitored natural attenuation response action provides no additional active remediation. It relies on natural chemical, physical, and biological processes to degrade contaminants in soil. This alternative requires ongoing periodic sampling and analysis of the soil samples to monitor the degradation process.

6.2.4.2 Containment

Containment of elevated concentrations of PAHs in soil is a potential response that could be implemented to prevent exposure. Containment actions would be implemented to prevent potential human and/or ecological contact by constructing an engineered cover system over areas of elevated concentrations of PAHs in soil.

6.2.4.3 Thermal Desorption

In situ thermal desorption uses a series of subsurface or in-well heaters that cause the applicable chemicals to volatilize. These contaminated vapors are captured and treated/oxidized prior to being released into the atmosphere.

6.2.4.4 Chemical Oxidation

In situ chemical oxidation (ISCO) mineralizes contaminants in place through the addition of a chemical oxidant, such as hydrogen peroxide, ozone, or sodium persulfate. The chemical oxidant is typically introduced into groundwater or saturated soil by injection into wells or the use of in-place soil mixing. Oxidants such as ozone can be introduced into the vadose zone through injection wells.

6.2.4.5 Soil Stabilization and/or Solidification

In situ soil stabilization uses chemical and pozzolan additives to immobilize and/or encapsulate contaminants in the soil. These chemical and pozzolan additives (cementitious material used in cements and concretes) are typically added to the soil by in-place soil mixing.

6.2.4.6 Bioventing

Bioventing enhances the natural biological activity through the introduction of atmospheric oxygen. Air is pumped into the soil through injection wells using low-pressure pumps. The injected air increases the oxygen level, allowing an increased rate of degradation of lighter and mobile fractions of organic contaminants in the soil. Bioventing is typically combined with monitored natural attenuation by measuring the oxygen depletion and the generation of carbon dioxide and other degradation products in monitoring wells near the injection well.

6.3 Remediation Technology Screening Results

The remedial action for the Site is intended to meet the RAOs by addressing elevated concentrations of COCs in soil so that exposure at the Site is reduced or eliminated. To achieve these objectives, soil remediation alternatives were selected during the screening process for further evaluation, as described in the following sections.

6.3.1 Soil Remediation Alternatives

A summary of the remediation technology screening results is presented in **Table 6-1**. The screening evaluation for the additional excavated soil treatment options is presented in **Table 6-2**.

The remediation alternatives are evaluated in detail based on their effectiveness at achieving RAOs, implementability, and cost.

To evaluate effectiveness, consideration was given to the overall protection of human health and the environment; reduction in toxicity, mobility, and volume; compliance with ADEQ requirements; and the long-term and short-term effectiveness of the alternative.

To evaluate the implementability of each alternative, the technical feasibility, commercial and administrative feasibility, and acceptance by ADEQ, the City, and the public were considered.

Previously conducted feasibility cost estimates were used to evaluate remedial action costs. The costs were evaluated in ranges of low, mid-range, and high cost based on both capital and operational cost.

6.3.1.1 Alternative 1 – No Action

Under Alternative 1, the no action alternative, no physical remedial actions would be performed to reduce the toxicity, mobility, or volume of contaminants identified in soil at the Site, and no land use controls or land use restrictions would be implemented at the Site. The no action alternative is presented to provide a baseline for comparison with other alternatives that provide a greater level of response.

Effectiveness

The no action alternative would not be effective because contaminants would remain at the Site, future human health and environmental risks would continue to be present, and the remedy does not meet APS's remedial objectives.

Implementability

The no action alternative would be technically easy to implement, but it does not protect human health and the environment and, therefore, is unacceptable.

Cost

No costs are associated with Alternative 1.

6.3.1.2 Alternative 2 – Institutional Controls

ICs under Alternative 2 include administrative land use controls, Site access restrictions, and other restrictions to minimize potential exposure from Site contaminants. The Site is currently secured by a fence and gates. Other ICs would include a DEUR on the property title and inclusion of the facility in the Terradex LandWatch Service to prevent unauthorized activities onsite.

Effectiveness

If properly implemented and maintained, ICs would be effective in limiting human exposure to contaminated soil and potential pathways of concern, such as dermal contact. Continued monitoring of ICs would be required to verify their continued effectiveness and ensure that the exposure pathways are being controlled. However, the remedy would not be effective because it does not meet APS's remedial objectives.

Implementability

ICs would be implementable under current site conditions; however, the City would be unable to develop the property for beneficial public use. The City would not be in favor of having restrictions or a DEUR placed on the Site, and regulatory agencies may not find ICs favorable as a standalone remedy for the Site. ICs can effectively address risks associated with the dermal contact pathway. The use of ICs would severely limit the City's use of the Site. Because contaminants would remain at the Site under this alternative, any future changes to land use would require addressing contamination. This remedy is difficult to implement because only the landowner (the City and/or private landowners) can put a property restriction on the property.

Cost

The cost range is estimated to be low. The total cost for Alternative 2 includes the administrative costs associated with implementing a Site DEUR, inspecting land use covenant implementation, performing annual monitoring to ensure the fencing is effective in preventing Site access.

6.3.1.3 Alternative 3 – Excavation and Offsite Disposal

Alternative 3 includes the excavation of soil exceeding Site cleanup goals. Fugitive debris and subgrade structures would be removed and disposed of offsite. Soil would be excavated using heavy equipment, loaded into trailers, and hauled to a licensed offsite disposal facility. The Site would be backfilled with imported clean soil and the surface restored per the City's requirements.

Effectiveness

The excavation and disposal alternative would be an effective and permanent remedial action. This alternative would reduce potential risks to human health and the environment by eliminating contaminants above residential SRLs. The contaminated soil would be removed from the Site and transported to an offsite disposal facility, eliminating contact with potential receptors. The physical removal of the soil would eliminate the exposure of contaminants to receptors and eliminate the mobility of contaminants.

Implementability

This alternative would be difficult to implement. Removal of soil would require mobilization and utilization of heavy equipment. To remove all soil exceeding SRLs, the excavation would need to be extended to at least the existing north Site boundary and potentially require permitting to encroach on the wash north of the Site. There are areas on the Site where the soil exceeds cleanup goals to a depth of more than 15 feet bgs. Excavation of soil to that depth will require sloping and potentially the design and installation of an earth support system, and/or utilizing an auger for soil removal.

Furthermore, high-pressure gas lines (El Paso Natural Gas and Southwest Gas) are located on the Site. These utilities would need to be protected in place and must be considered and addressed to the project.

Excavation activities would result in significant disturbance both onsite and offsite. A substantial amount of pedestrian traffic crosses the entrance to the Site, which will need to be protected during excavation due to additional truck traffic during hauling of soil for disposal. Pedestrian traffic engineering controls would likely need to be implemented to protect the public.

Cost

The cost of Alternative 3 is high. The alternative would include excavation, transportation, disposal, and utility avoidance.

6.3.1.4 Alternative 4 – Containment by Capping and Institutional Controls

Alternative 4 includes the construction of an engineered cover system over the Site along with ICs as described in Alternative 2. The cover system would consist of the existing concrete slabs. New asphalt pavement would be placed over the impacted soil.

Effectiveness

If properly implemented and maintained, a cover system with ICs would be effective in limiting human exposure to contaminated soil and potential pathways of concern, such as dermal contact. Annual inspection of the cover system, along with continued monitoring of ICs, would be required to verify the continued effectiveness and control of exposure pathways. However, the remedy would not be effective because it does not meet APS's remedial objectives.

Implementability

The difficulty in implementing this alternative would be moderate. Regulatory agencies may not find the cover system with ICs favorable as a standalone remedy for the Site. The cover system and ICs can effectively address risks to the dermal contact pathway. The use of a cover system would limit the City's future use of the Site; because contaminants would remain at the Site under the cover system, any future subsurface work, including replacement or repairs to utilities, would require breaching the cover system to perform the work. Any future changes to land use would require addressing contamination. A cover system would require a DEUR, with an annual inspection requirement, to be placed on the Site title, which would not be acceptable to the City due to limitation of future property development. This remedy would be difficult to implement because only the landowner (the City and/or private landowners) can put a property restriction on the property.

Cost

The cost range of Alternative 4 is estimated to be moderate. The total cost for Alternative 4 includes the capital cost of installing the asphalt and the administrative costs of implementing a Site DEUR; inspecting the covers system and fencing; conducting maintenance and repairs; and training future staff who work onsite.

6.3.1.5 Alternative 5 – In Situ Chemical Oxidation

This alternative consists of injecting a chemical oxidant into the impacted soil zones at the Site. Because the impacted soil is located in the vadose zone, a gas-phase oxidant such as ozone could be used to achieve greater contact with impacted soil. The system would require the installation of an ozone generator and one or more new onsite injection wells. Several soil vapor monitoring wells (SVMWs) would also be required to evaluate the effectiveness of the system. The SVMWs may be used for soil vapor extraction. The system would be operated to maintain high levels of ozone in the subsurface over a relatively short period of time. The operation of the system would be monitored by measuring the soil vapor concentrations, the consumption of oxygen, and the production of carbon dioxide and degradation products (including methane) in SVMWs around the Site.

Effectiveness

The use of ISCO with ozone in the vadose zone has been effective with some high molecular weight compounds, though it may not be possible to achieve levels below SRLs. The use of a gas increases the potential of oxidant contact with impacted soil. This alternative does not address potential soil contamination from lampblack near the surface onsite. ISCO would not reduce lead concentrations above the residential SRL and GPL. ISCO will not be effective as it does not meet APS's remedial objectives.

Implementability

The difficulty of implementing the ISCO system is moderate to high because of its limited reach to deeper onsite soil. Regulatory agencies would not likely accept ISCO as a standalone remedy. The system requires the design and installation of an ozone generating system, installation of one or more injections wells, and installation of several SVMWs. The use of a system with a corrosive gas in a residential area may cause safety concerns to residents, in addition to workers operating the equipment, and require inclusion of process safety systems. If soil vapor extraction is used, a county air permit may also be required. The injected ozone is highly corrosive. Although the injection system could be designed for the corrosive environment, the impacts on the high-pressure gas lines in the area would need to be evaluated. ISCO also carries a high worker risk during implementation due to worker exposure to corrosive chemicals.

Cost

The cost of the ISCO system would be high. The capital cost of the ISCO system would include installation of an ozone generation system and one or more injection wells. Several SVMWs also would

need to be installed to monitor system operation. The system would require ongoing long-term operation, maintenance, monitoring, and repairs. Soil vapor monitoring would likely need to continue for several months until the remediation is complete.

6.3.1.6 Alternative 6 – Bioventing

This alternative consists of installing a bioventing system to pump atmospheric air into one or more new onsite injection wells. The system would be operated to maintain oxygen levels in the subsurface near atmospheric levels. System operation would be monitored by measuring the consumption of oxygen, as well as the production of carbon dioxide and degradation products, including methane in SVMWs around the Site.

Effectiveness

This alternative would not be effective because most of the Site PAH compounds have high molecular weights, and remediation effectiveness would be limited and very slow. Bioventing would not reduce lead concentrations in the soil and would not meet APS's remedial objectives.

Implementability

The difficulty of implementing the bioventing system is low to moderate because of its limited onsite use. Regulatory agencies would not likely accept bioventing as a standalone remedy. The system would be relatively easy to install onsite. The system would require the installation of soil vapor injection wells and SVMWs. The system would need to operate for many years and could interfere with the City's operations at the Site.

Cost

Cost of the bioventing system would be moderate. Capital cost of the bioventing system would include a small blower unit and wells. The system would require ongoing operation, maintenance, monitoring, and repairs. Also, soil vapor monitoring would likely need to continue for several years until the remediation is complete.

7. Recommended Remedial Alternative

This section describes the goals and objectives of the proposed remedial action, presents the regulatory cleanup requirements, and describes the pre-remediation and remediation activities, the sampling and analysis procedures, the Site restoration activities, and the post-remediation activities.

Based on the technology evaluation presented in Section 6.3, the remedial action recommended to meet RAOs is Alternative 3, Excavation and Offsite Disposal. The excavation depths will range from up to 5 feet bgs over a portion of the Site to up to 22 feet bgs under the north gas holder where the deepest impacts were reported. Proposed excavation locations and DUs are shown on **Figure 7-1**. Excavation depths within the DUs are shown on **Figure 7-2**. This remedial action will reduce the concentration of PAHs and lead in soil to below residential SRLs. A detailed discussion of the proposed excavation areas and how the recommended remedial action will meet the RAOs is provided in Section 7.4.6.

A project-specific health and safety plan (HASP) will be submitted for the remedial activities. The HASP will outline the minimum health and safety requirements for personnel working on Site remedial activities. The HASP will include the following:

- Project Site description
- Project organization and tasks to be performed
- Hazard evaluation and control
- Personnel training and requirement
- PPE
- Air monitoring specifications
- Decontamination
- Emergency response plan and contacts

The Quality Assurance Project Plan (QAPP) (Jacobs, 2019c) was prepared for APS's MGP and other sites. The QAPP was developed as specified in *EPA Requirements for Quality Assurance Project Plans for Environmental Data Operations* (EPA, 2001a). The QAPP provides a description of the analytical methods to be used, the applicable laboratory analytical methods, and the quality assurance (QA)/quality control (QC) procedures used to evaluate the data.

7.1 Cost Recovery

The remedial actions to be implemented based on this RAP will be undertaken by APS. APS will not seek to recover any of the costs associated with the implementation of the RAP from any other responsible party.

The undersigned hereby certifies that to his/her knowledge, cost recovery from another responsible party will not be made.

7.2 Cleanup Criteria

The purpose of the cleanup is to allow residential and non-residential use of the property after remedial activities are complete and to prevent potential impacts to groundwater. The following sections present the selected cleanup criteria for the remedial action at the Site.

7.2.1 Chemicals of Concern

Jacobs identified the final COCs at the Site based on former MGP operations and the results of previous and pre-design testing investigations. **Table 7-1** lists the compounds that were evaluated as potential COCs for the remedial action. **Table 7-2** presents the final COCs identified at the Site and the associated cleanup criteria.

7.2.2 Goal of Remediation

APS is conducting the remedial action under ADEQ's VRP oversight. The goal of this remediation is to reduce COC concentrations in soil to levels below applicable regulatory cleanup criteria, as discussed in Section 7.2.3. The COCs requiring remediation are primarily PAHs but also include lead (**Table 7-2**).

7.2.3 Applicable Regulatory Cleanup Criteria

This section discusses soil remediation criteria for the remedial action.

7.2.3.1 Soil Remediation Criteria

Numeric soil cleanup regulatory criteria are established by ADEQ as SRLs and GPLs, and are described in the following sections.

Soil Remediation Levels

SRLs are predetermined risk-based remediation levels derived from toxicity data using defined assumptions for possible exposure. SRLs are developed by the ADHS Office of Environmental Health for ADEQ (ADEQ, 2009) and are based on the following:

- EPA Region 9 Preliminary Remediation Goals (PRGs)
- Ingestion, inhalation, and dermal contact risk criteria
- ELCR of 1×10^{-6} for Class A (known human) carcinogens, and 1×10^{-5} for Class B and C carcinogens
- HI no greater than 1 for noncancer-causing contaminants

Because of the varied applications of SRLs, the underlying assumptions for their development are very conservative.

The application of SRLs is based on future land use and the potential for contaminated soil to impact human health. Contaminated soil can be remediated to background concentrations, the predetermined SRLs (A.A.C. Title 18, Chapter 7, Article 2), or site-specific remediation standards. SRLs are established for both residential and non-residential uses. Where soil is remediated to the non-residential SRL, but above the residential SRL, the property owner must attach a DEUR to the property deed. Compounds identified in the 2007 SRLs as carcinogens include residential SRL values for both 1×10^{-5} and 1×10^{-6} ELCRs. A.A.C. R18-8-205 states, "a person who elects to remediate to a residential SRL may utilize a 1×10^{-5} excess lifetime cancer risk for any carcinogen other than a known human carcinogen. If the current or currently intended future use of the contaminated site is a child care facility or school where children below the age of 18 are reasonably expected to be in frequent, repeated contact with the soil, the person conducting remediation shall remediate to a 1×10^{-6} excess lifetime cancer risk."

SRLs are developed based on exposure to soil and do not incorporate risk associated with potential leaching of contaminants from soil to groundwater. SRLs may be used only as remediation standards when the value is also protective of aquifer water quality.

Groundwater Protection Levels

To evaluate whether impacted soil may pose a threat to groundwater, ADEQ developed a model for determining soil concentrations protective of groundwater quality using mathematical calculations of contaminant partitioning between soil and groundwater to estimate GPLs (ADEQ, 2013). The modeling result is a projection of the leaching potential of COCs from impacted soil to groundwater. GPLs can be calculated for site-specific conditions or a predetermined worst-case scenario. The worst-case scenario is referred to as the minimum GPLs, which are soil concentrations that are protective of groundwater quality under a condition where contaminated soil is in contact with groundwater. Site-specific GPLs can be calculated using geotechnical data and physical properties of the compounds.

HHRA Criteria

The HHRA identified three COCs in soil below 15 feet bgs at the Site, which included arsenic, naphthalene, and BAP TEQ (which represent a total risk value for seven carcinogenic PAH compounds). Naphthalene and arsenic each have residential SRLs, and each of the seven BAP TEQ compounds (benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenz(a,h)anthracene, and indeno(1,2,3-cd)pyrene) that comprise the BAP TEQ have applicable SRLs. Therefore, the residential SRLs will be used as cleanup criteria in lieu of developing site-specific HHRA values.

7.2.4 Site Cleanup Criteria

The Site cleanup criteria are based on remediating accessible soil to concentrations of COCs that are protective of human health and the environment. Residential SRLs (using a 1×10^{-5} ELCR), non-residential SRLs, and minimum GPLs were compared for the Site, and the lowest appropriate remediation level, based on future land use, was selected by APS. Additionally, the COCs identified in the HHRA were compared to the COCs identified based on SRLs to arrive at a final list of COCs for the remedial action. Applicable Site cleanup criteria for COCs are listed in **Table 7-2**. To allow future unrestricted use of the Site property, the residential SRLs will be used as the soil cleanup criteria.

7.3 Pre-remediation Activities

To meet remediation goals for the Site, APS will complete the following pre-remediation activities before the contractor starts the remedial activities:

- Property ownership review and coordination
- Regulatory review and permitting
- Public notice and public participation
- Utility clearance

7.3.1 Property Ownership and Utilities Review and Coordination

The Site property is owned by the City and private property owners. APS has obtained an access agreement from the City and private owners to perform the remediation work on the Site.

El Paso Natural Gas and Southwest Gas have high-pressure gas supply pipelines that are located under the Site on City and private property and run between excavation areas. Southwest Gas has provided APS with excavation guidelines (Southwest Gas Form 279.0 (02/2013) for work around Southwest Gas utilities. APS will work with the gas companies for excavations around the pipeline. As a matter of public and worker health and safety, excavation will not occur within 10 feet of the high-pressure gas lines without coordinating with the pipeline owners. Southwest Gas excavation guidelines are provided in Appendix M.

7.3.2 Regulatory Review and Permitting

As part of the remedial construction activities, federal, state, and local laws require APS to obtain certain environmental- and engineering-related permits. While permitting activities have been initiated, many of the final permits cannot be obtained until the remedial design is approved and a contractor is selected. Based on existing Site information and agency input, the following permits have been identified as being potentially required to implement the activities specified in the RAP. Based on final agency input after initial permit application submittal and/or changes in activities at the Site, additional permits and/or approvals may be required.

City of Douglas Construction Permit

The Site is located within the City incorporated area. Therefore, in accordance with Title 15 of the *City of Douglas Code of Regulations* and conversations with City personnel, a right-of-way permit application, including the haul route, must be submitted to the City.

APS will coordinate with the City to submit the required application and associated information.

If tree removal is required, the permitting will be coordinated through the City adhering to City tree removal permitting requirements.

Floodplain Use Permit

Based on a review of Federal Emergency Management Agency flood control maps, the Site is not located within a regulatory floodplain. However, in *Arizona Revised Statutes* (A.R.S.) 48-3610 the Arizona State Legislature enabled the City to assume the powers and duties for floodplain management and adopt regulations in conformance with A.R.S. 48-3609 designed to promote the public health, safety, and general welfare of its citizenry (*City of Douglas Code of Regulations*, Chapter 15.20). If the City requires a floodplain use permit, the City will issue a floodplain use permit during the right-of-way permitting process.

Arizona Pollutant Discharge Elimination System Construction General Permit

The anticipated area of disturbance at the Site, including excavation, equipment staging, and other earth-disturbing activities conducted during the remedial activities is expected to exceed 1 acre. A general construction permit will be required per A.A.C. R18-9-A905 and 40 *Code of Federal Regulations* (CFR) 122.26(b)(15), and a notice of intent must be submitted to ADEQ. The anticipated total area of disturbance is greater than 1 acre; therefore, a notice of intent will be required for this remediation project. Additionally, a stormwater pollution prevention plan will need to be prepared for the Site. The stormwater pollution prevention plan will include best management practices and inspection procedures during all construction activities.

Arizona Department of Water Resources Permit for Dewatering Activities

Based on existing groundwater levels, it is not expected that the excavation activities at the Site will require dewatering for completion. However, if dewatering is required, the final dewatering system design will be prepared by the remediation contractor in accordance with requirements in the project specifications. APS will obtain the required Arizona Department of Water Resources permit to meet permit conditions and reporting requirements.

Special and Hazardous Waste Requirements

Because soil sampling results indicate that PAHs are present in Site soil above residential and non-residential SRLs, the soil intended for excavation meets the definition of an Arizona special waste PCS. Therefore, offsite soil disposal requires that the generator must have a special waste generator identification number (ID) and that the transporter must be registered with ADEQ as a special waste shipper. The APS Arizona Special Waste PCS ID number is 320482 and the PCS was issued December 9, 2019.

If soil excavated from the Site contains contaminants in concentrations exceeding hazardous waste TCLP levels, the soil will be transported to a facility licensed to receive hazardous waste, but it will be transported as a special waste PCS per the MGP exemption discussed in Section 7.4.8; therefore, a hazardous waste generator ID will not be required.

APS will use a qualified contractor or contractors to transport materials for offsite disposal. APS will verify that any contractor used has the appropriate authorization from ADEQ or EPA to transport the waste materials.

If the soil exhibits the hazardous waste characteristics of corrosivity, reactivity, or ignitability based on analytical results for these parameters, it will be managed as a hazardous waste and will be properly manifested. Copies of manifests will be submitted to ADEQ.

Special waste PCS and/or hazardous waste will be transported to a facility permitted for disposal of these wastes. The soil will be stored prior to disposal in accordance with the requirements for special waste PCS or the requirements for hazardous waste, if applicable. APS will report quantities of special waste shipped from the Site via ADEQ's Special Waste Generator Annual Report Form.

National Emissions Standards for Hazardous Air Pollutants Notification and Demolition Permit

The Site contains no aboveground structures. Subsurface concrete structures are present at the Site and will require sampling prior to disposal. If transite (asbestos) pipe is encountered, or any other asbestos-containing suspect buried material is exposed in a DU, an asbestos survey of the structure to be demolished will be conducted by a certified Asbestos Hazard Emergency Response Act (AHERA) inspector. If asbestos-containing material (ACM) is present, an asbestos abatement contractor will remove the ACM prior to excavation of the DU. A National Emissions Standards for Hazardous Air Pollutants (NESHAP) notification will be filed with ADEQ at least 10 days prior to removal and/or ACM abatement. There is also the potential for ACM to be encountered in subsurface structures or pipelines within the limits of the excavation. If suspected ACM is encountered and/or is planned to be removed, a certified-AHERA inspector will evaluate the structure and collect required samples. If the presence of ACM is verified over the threshold quantities, the appropriate NESHAP notifications will be made to Cochise County at least 10 days before removal of the ACM. All ACM will be managed in accordance with appropriate waste management requirements.

Dust Control Requirements

Based on discussion with representatives of the City, dust control requirements during demolition and excavation activities will be addressed by the City during issuance of the right-of-way permit/approval. Cochise County does not have dust control requirements associated with activities inside the City. However, Cochise County has a land clearing ordinance (No. 00-030) and clearing permit that is submitted with the City construction permit application. Dust control measures using water will be actively applied during all excavation activities to prevent dust.

Section 404 Permit and Supporting Documentation

Construction activities that result in the discharge of dredged or fill material to the "waters of the United States" require a Clean Water Act Section 404 permit issued by the U.S. Army Corps of Engineers (USACE). A wash that is likely jurisdictional is located across the northern portion of the Site and, based on the location of impacted soil near the wash, remediation activities have the potential to affect this wash.

A public records request for previous jurisdictional determinations for the area was submitted to the USACE in December 2019. The 2003 and 2004 jurisdictional determinations were received in January 2020 and will be used as reference documents during the Section 404 investigation and permitting processes. A new preliminary jurisdictional delineation was conducted in December 2019 to evaluate the project area and identify potential waters of the United States. APS will submit a Section 404 Nationwide Permit No. 38 preconstruction notification to the USACE to request authorization for potential activities in

the wash because (1) the preliminary jurisdictional delineation indicated that the wash determined jurisdictional in 2003/2004 still exhibits characteristics of an ordinary high water mark, and (2) remediation activities have the potential to affect at least one wash recommended as waters of the United States. The preconstruction notification will document compliance with the requirements of Nationwide Permit No. 38, including cultural and biological reviews and other applicable information. Activities cannot commence within any washes recommended as jurisdictional until the USACE has approved the preconstruction notification and issued the permit.

Excavation and related activities at the Site are anticipated to have no effect on threatened and endangered species or their habitat. This assessment is based on the lack of suitable habitat at the Site for any special-status plant or wildlife species, as identified by the U.S. Fish and Wildlife Service and Arizona Game and Fish Department. Therefore, consultation pursuant to Section 7 of the Endangered Species Act is not anticipated.

No known cultural resources sites are located within the anticipated footprint of the excavation and related activities at the Site. Therefore, a project finding of “no historic properties affected” will be recommended to support the USACE’s responsibilities under Section 106 of the National Historic Preservation Act. While no further cultural resources work will be recommended along with the project finding, the USACE makes the final decision as to whether Section 106 consultation will be required to support the preconstruction notification. If the USACE chooses to consult with the Arizona State Historic Preservation Office and Tribes, draft Section 106 consultation letters will be prepared and submitted to the USACE.

To streamline the permitting process, the USACE will allow the preliminary jurisdictional delineation and preconstruction notification to be combined into one submittal. The USACE review time is anticipated to be about 45 days if Section 106 consultation is not required and about 2 months with Section 106 consultation.

7.3.3 Public Notice and Public Participation

APS has a community relations and public involvement program for the Site. APS will give the ADEQ-required public notice, specified in A.R.S. Section 49-176, in addition to performing other proactive public participation activities. APS will prepare Site status newsletters in both English and Spanish and distribute them to neighboring businesses, residents and community leaders. A mailing list will be developed that includes community leaders, media outlets, neighboring businesses, residents, and interested community members.

As part of APS’s continuing public involvement program, the following additional outreach measures will be taken once the RAP is completed and approved by ADEQ:

- Develop a specific community involvement program that includes state and local participants.
- Update the newsletter to include RAP information and distribute to interested parties.
- Conduct a community leader briefing.
- Maintain a sign at the Site with the name and telephone number of a person who may be contacted for information regarding the field work, in accordance with A.R.S. Section 49-176(A)(2)(a).
- Provide construction updates to the community once work at the Site begins.
- Post a legal notice in *The Douglas Dispatch* newspaper regarding the availability of the RAP for review and the time of the public comment period.
- Provide a public comment period (30 days) as required in Section 49-176. The comment period will run concurrently with the activities described previously. As part of the public comment period, APS will hold an open house to provide nearby residents and businesses information on the remedial activities and request more information.
-

The remediation at the Site is anticipated to take approximately 6 months. During this time, APS will develop a construction progress newsletter for periodic distribution to the community.

7.3.4 Utility Clearance

During the pre-design testing investigation, known utilities were located with the assistance of Blue Stake and utility personnel. AZTEC was also hired to designate and survey utility lines using signal line generators and ferrous magnetic locator method and to survey the locations of the utilities. The objective of the utility evaluation was to identify utility locations and potential issues that may have impacted the pre-design testing investigation and the remedial design. **Figure 7-2** shows the location of the detected utilities.

The main underground utilities on the Site are the El Paso Natural Gas and Southwest Gas high-pressure gas lines. For health and safety reasons the gas lines will not be exposed during the planned excavation activities. Excavations will be located at least 10 feet from the gas lines unless closer work is authorized by the gas utility, APS, the Jacobs responsible health and safety manager, and the contractor. No other utilities are anticipated to impact excavation activities. Overhead power lines run parallel to the gas line on the west side of the Site and are not anticipated to impact excavation activities based on pre-design testing investigation results. Southwest Gas excavation guidelines are provided in Appendix M.

Because of the presence of underground utilities in the proposed excavation areas, an updated Blue Stake ticket will be maintained at all times during the project.

7.3.5 Access Agreements

APS has secured access agreements from the City and private property owners to complete the remediation activities described in this RAP.

7.4 Remediation Activities

7.4.1 Mobilization

The contractor selected by APS will be responsible for mobilization to the Site. APS will gain prior approval from the City and private property owners for Site access, construction trailer locations, and utility hookups such as electrical, and communications. The following activities will be performed as part of mobilization:

- Construction trailers and the required utility hookups will be placed (Jacobs/APS trailer and contractor trailer). Trailers will be equipped with all equipment listed in the contract specifications, including heating, air conditioning, lighting, electrical, telephone service, fax machine, and copier.
- Equipment mobilization will include excavators, loaders, pressure washers, sampling equipment, air monitoring equipment, and health and safety equipment.
- Run-on/runoff control measures will be established that may include silt fences, hay bales, and silt curtains.
- A pre-construction meeting will be conducted to review all aspects of the project, including health and safety, access, authorized personnel, construction schedule, change orders, odor and dust control, stormwater management, and soil and debris segregation.
- Photographs will be used to document the pre-construction conditions of all equipment, roads, driveways, buildings, and any features that might be affected by the remedial activities. This documentation will be conducted prior to the initiation of any construction activities at the Site and updated as Site conditions change.

7.4.2 Site Security and Site Access

The Site is currently enclosed by a 6-foot chain-link fence installed on October 28, 2019. Additional fencing will be placed around any work areas that may extend beyond the existing fence. The location of the perimeter fence is presented on **Figure 7-1**.

Access to the project Site's work areas will be limited to APS, Jacobs, and contractor personnel. All other visitors, including utility and City personnel, will need to be escorted in Site work areas by a designated person selected by APS. All employees and visitors will be required to check-in and sign a visitor's log in the contractor's trailer. Only personnel with the proper training and safety equipment who have reviewed and signed the project HASP will be allowed access to the work areas. APS will coordinate Site activities with Customs and Border Protection (border patrol) and the Department of Homeland Security prior to construction activities.

The contractor will supply, install, and maintain all road markings, signs, and barriers to prevent vehicle and pedestrian traffic access to certain areas. During nonworking hours, the contractor will secure the Site work areas to ensure that unauthorized personnel, such as trespassers, vagrants, children, or animals, do not enter the Site. Additionally, the remediation contractor will coordinate with El Paso Natural Gas and Southwest Gas to protect the high-pressure gas pipelines.

7.4.3 Site Preparation

The following tasks will be implemented during the Site preparation phase; these activities are detailed in other sections of this RAP:

- The contractor will mobilize to the Site and prepare the Site for work activities.
- Site work areas are enclosed by a 6-foot chain-link fence. Additional temporary fencing will be installed were needed based on actual Site conditions at the time of excavation. The fence(s) will be covered with fence fabric to limit visibility into the work area and minimize dust migration into and out of the work area unless the border patrol requires a clear field of vision across the Site. A misting system will be installed on the top of the fence to help prevent dust from migrating offsite.
- Work, decontamination, and support areas will be identified and clearly marked.
- Temporary facilities and utilities, such as office trailers, sanitation facilities, power, lighting, and telephones will be installed, as necessary, for use by the onsite personnel.
- The Contractor will work with Southwest Gas to expose existing high-pressure gas line to positively confirm the location. Southwest Gas inspector will be present for any excavation work within 5 feet of the pipeline. Once the pipeline is exposed, deeper excavation can take place. Southwest Gas excavation guidance is provided in Appendix M.
- Existing trees and shrubs within the excavation work areas will be removed as needed with City approval and permits as required.
- Asphalt, wood, or concrete slabs within the excavation area will be removed.

7.4.4 Protection of Existing Site Features

All necessary precautions will be taken to protect the existing above- and below-ground structures surrounding the Site. Site features requiring protection during remedial activities will be identified and the necessary protective controls installed prior to excavation. The main features of concern are buried high-pressure gas lines and overhead electric lines.

7.4.5 Work, Decontamination, and Support Areas

Prior to beginning remedial activities, the Site will be divided into work, decontamination, and support areas as defined by the HASP. This section outlines the three areas to be established by APS, Jacobs, and the contractor.

7.4.5.1 Work Area

The work area is the portion of the Site where excavation activities will be conducted. The planned excavation will be performed in small sections to minimize the possibility of adverse effects caused by a significant rain event. Barricades with caution ribbon will be installed within the work area to designate an exclusion zone. To minimize the potential for cross contamination from the excavation area, the following procedures will be followed:

- Personnel not directly involved with the work activities will not be allowed within this zone.
- All personnel and personal vehicles will park in a designated lot outside the project work area. All personnel will enter near the construction trailers and sign-in daily.
- All personnel entering the exclusion zone will be required to wear appropriate PPE.
- Personnel leaving the exclusion zone will be decontaminated prior to exit.
- All PPE will be collected and disposed of properly.
- Every truck loaded for offsite disposal of impacted material will be dry decontaminated before the truck leaves the Site. Dry decontamination includes the truck, the trailer, and tires. All loads will be covered before leaving the Site. Tracking out material will be prevented by loading trucks on a clean gravel surface. In the event of rain, one of two options will be implemented:
 - **Option 1:** Suspend loading operations and offsite disposal of impacted material.
 - **Option 2:** Place 0.75-inch gravel on the ground between the loading point and the Site access point.
 - **Option 3:** Place and maintain shaker plates near the construction entrance.
- All equipment used to excavate impacted soil will stay within the exclusion zone. If the equipment leaves the exclusion zone or comes into contact with clean soil, the equipment will be decontaminated.

Impacted material will be segregated as described in Section 7.4.8. The contractor will excavate only the soil that can be loaded and hauled out the same day or placed in a lined stockpile area or roll-off container to minimize the amount of soil potentially causing fugitive odors and dust. Soil stockpiles or roll-off containers will be covered each night and when not in use.

7.4.5.2 Support Area

The support area is located outside the exclusion zone where no PPE is required. This area includes the construction trailers, designated eating areas, parking lot, material storage, visitors' area, and vehicle access.

7.4.5.3 Decontamination Area

The decontamination area will be located between the work area and the support area. All personnel will be required to enter and leave the work area through this access. If necessary, the contractor will set up a three-stage decontamination area with plastic bins that will be lined with plastic sheeting. The workers will be required to remove all PPE and equipment that was used within the work area. Boots will be rinsed and scrubbed with brushes to remove any residual contamination. All PPE will be disposed of properly. No smoking or eating will be allowed in the work or decontamination areas.

7.4.6 Excavation Activities

The excavation plan is designed to manage the uncertainties that typically accompany remediation of a site with a lengthy history of multiple activities. The excavation at the Site is designed to accomplish the RAOs by removing PAH and lead impacted soil that exceeds residential SRLs. The general areas proposed for excavation include the following:

- Excavate soil up to 5 feet bgs at the former south gas holder location near soil boring B-11.
- Excavate soil up to 15 feet bgs at the former meter house and southwest of the small purifiers area between the former gas holders near soil borings B-13 and B-17.
- Excavate soil up to 20 feet bgs east of the former small purifiers near soil boring B-24.
- Excavate soil up to 22 feet bgs at the former north gas holder location near soil boring B-12.
- Excavate soil up to 10 feet bgs at the former generator house and oil sump location (shown as Excavation Area DU-2).
- Excavate soil up to 20 feet bgs near the north fence line north of the former oil sump location.
- Excavate soil up to 7 feet bgs north of the north fence line and west of the boring B-21.
- Excavate soil up to 5 feet bgs north of the former generator house and soil boring B-15.

The proposed excavation areas are shown on **Figure 7-1**.

Historic locations of the remaining subsurface MGP features should be considered approximate. During the pre-design testing investigation, a flat concrete feature was present near the location of soil boring B-24 at ground surface. Soil boring B-24 was moved to the east of the feature to allow hand auger clearing; the historical reports had no record of this feature. Soil boring B-23 was advanced through soil; however, based on historical feature locations the former north gas holder foundation would have been located at boring B-23. The locations of former MGP structures are based on 1929 Sanborn Fire Insurance Company maps and provide approximate locations of known former MGP structures. Removal of subsurface MGP features will take place during excavation activities. Approximate locations of subsurface MGP features are shown on **Figure 7-1**.

7.4.6.1 Excavation

Based on the previous investigations and the pre-design testing investigation, Jacobs estimates that approximately 24,000 tons of impacted soil will be removed by the contractor and hauled to a special waste landfill at an APS-approved offsite treatment facility. Due to sloping and shoring requirements and field conditions, the estimated quantity of soil removed, the excavation time may vary. APS will develop an excavation plan with the contractor based on the following criteria:

- Health and safety requirements will be adhered to for the protection of workers, Site personnel, and the community (air monitoring, odor and dust control, noise).
- Underground and overhead lines will be avoided.
- Excavation will be performed to remove the material that exists at concentrations above the cleanup criteria for the Site.

The excavation plan is based on the following criteria:

- Contractor hours: 5 days per week, 10 hours per day
- Excavation rate: 100 to 300 tons per day
- Material offsite disposal: 5 to 15 trucks per day (average 20 tons per truck)

7.4.6.2 Debris Cleaning and Processing

Construction debris, such as concrete from demolition activities, buried concrete, abandoned utilities, and brick, will be removed and segregated during the excavation activities. This material will be visually inspected to evaluate whether the material is appropriate for disposal at a recycling facility or an APS-approved, locally permitted solid waste landfill. Debris that cannot go to a recycling facility or a locally permitted solid waste landfill because it is contaminated will be manifested as special waste and disposed of at a licensed landfill.

If material appears to contain ACM, or if transite (asbestos) pipe is encountered during the remedial activities, an AHERA-certified asbestos inspector will inspect the material or piping and collect samples of the material. If ACM is identified, a licensed asbestos abatement contractor will be contacted to remove and dispose of the ACM. The material will be double-bagged, labeled, manifested, and disposed of at an APS-approved disposal facility. If threshold quantities are exceeded, appropriate NESHAP notifications will be made to ADEQ.

7.4.7 Air Quality Monitoring

Air quality monitoring will be conducted during the remedial activities in accordance with the project HASP. Air monitoring is designed to identify and quantify airborne contaminants, evaluate the impact of Site activities on the worker, and reduce or eliminate the migration of dust and odors offsite. Real-time air monitoring of PAHs will be required during trenching, excavating, and loading of impacted soil. Additionally, during excavation at areas which had lead results above the residential SRL (soil at the former gas holders from soil borings B-11 and B-12), dust monitoring will be conducted to provide real time estimates of lead concentrations.

At no time will the contractor perform remediation activities without a designated Site Safety Coordinator (SSC) overseeing the work area. Daily safety meetings will be conducted to review air monitoring results with workers and discuss the planned work schedule for that day's activities. The SSC will be responsible for determining appropriate PPE and decontamination procedures. In addition, the SSC will conduct hourly air monitoring of the Site perimeter and document readings for VOCs, carbon monoxide, oxygen, lower explosive limit, dust, and noise. A copy of the perimeter air monitoring logs will be kept in the contractors' trailer, which will be available upon request and will become a part of the RAP documentation records.

7.4.7.1 Dust and Odor Control

Dust and odor controls will be implemented at the Site to ensure worker safety and minimize offsite emissions. The following mitigation measures will be implemented at the Site to control emissions:

- Continuously monitor the wind direction with a wind flag or electronic weather monitoring device for changes. In the absence of an electronic weather monitoring device, the wind direction, wind speed, barometric pressure, precipitation, and temperature will be downloaded daily from the local weather station website (<http://www.wunderground.com/US/AZ>) and recorded in the Site log.
- Minimize the size of excavations.
- Cover stockpile and roll-off containers with a permanent cover or plastic sheeting or a tarp when not in use.
- Install water misters at the fence line to intercept dust and odors prior to leaving the excavation area.
- Apply water alone or water with environmentally safe additives (for example, Envirotech Vapor Suppression, Simple Green, or equivalent) on the excavation area, haul roads, and roll-off containers to control dust and other emissions.
- Apply environmentally safe chemical suppressants or foams (for example, Eco Sorb, Citriclean, Rusmar or equivalent).
- Cover exposed areas with clean fill.
- Stop excavation activities if Site conditions are such that mitigation measures prove unsuccessful in controlling emissions.

The contractor will be responsible for performing all dust and odor controls during the remedial action. The effectiveness of dust and odor controls will be determined by the air monitoring results. Dust control activities will be performed in accordance with requirements specified by the City when applicable building permits are obtained for the excavation activities.

7.4.7.2 Air Monitoring

Health and Safety Air Monitoring (Active Work Areas)

A detailed description of the practices and procedures will be included in the site-specific HASP. The contractor will be responsible for monitoring its employees. At a minimum, each employee should have completed a 40-hour training course for hazardous waste site workers (Occupational Safety and Health Administration 29 CFR 1910.120) and all appropriate refresher courses, be part of a medical monitoring program, and be certified to wear a respirator. Health and safety monitoring may use following equipment:

- Photoionization detector (PID) for monitoring VOC levels in air
- Colorimetric tubes to identify specific types and concentrations of VOCs in the air
- Combustible gas indicator for monitoring oxygen, carbon monoxide, hydrogen sulfide, and explosivity levels
- Miniram dust meter (PDM-3 or equivalent) for real-time dust level monitoring
- Decibel meter to monitor noise levels

The contractor will monitor the work area at all times while excavation activities are being conducted. Additionally, the contractor will monitor the perimeter of the work area for odors and dust on an hourly basis during work activities. The results of the work area and perimeter monitoring will be documented and maintained onsite for the duration of the project. At the conclusion of the project, the records will be turned over to APS.

Baseline (Background) Air Monitoring

Baseline (background) monitoring will be conducted for the four monitoring locations identified for perimeter air sampling. Samples will be collected with high volume (HIVOL) samplers and analyzed using EPA Compendium Method TO-13A. Samples will be collected during the mobilization activities prior to any excavation at the Site. The background samples will be submitted to a qualified ADHS-licensed laboratory for analysis. Background sample results will be compared to the HIVOL air analytical results obtained during the remedial activities.

Background samples will also be collected using hand-held monitoring equipment as specified in the HASP for air monitoring. The data will be collected within the Site and at the upwind and downwind perimeter of the Site. The data will be recorded and stored onsite for comparison during the remedial activities.

Perimeter Air Monitoring

Perimeter air monitoring will be performed to verify compliance with project action levels, which were calculated based on a 1-year, 6-month, or 4-month exposure duration, as presented in **Table 7-3**. The EPA RSLs for air quality (<https://www.epa.gov/risk/regional-screening-levels-rsls-generic-tables>) were used to calculate the action levels, based on an assumed 26-year residential exposure duration. This is the relevant update to the EPA Region 9 PRGs for Ambient Air Values, which were used previously.

The typical air monitoring positions will include one upwind sampler and one downwind sampler with respect to the prevailing wind direction, predominantly from west or east. Because of the Site's proximity to surrounding businesses and residents, four perimeter air monitoring stations may be used during excavation. The proposed air monitoring locations are shown on **Figure 7-3**. Sampling procedures, analytical methods, and QA/QC procedures are presented in the QAPP (Jacobs, 2019c).

Each sampling location will be equipped with a modified HIVOL sampler consisting of a sampling pump system with a flow range greater than 200 liters per minute, an orifice and magnehelic gauge to document continuous flow rate, and a sample module that includes a polyurethane foam (PUF) and/or XAD-2 cartridge and quartz filter. Air samples will be collected on an approximate 24-hour basis during

excavation and waste loading/hauling activities. Each sample will be analyzed for SVOCs by EPA Compendium Method TO-13A high-performance liquid chromatography (HPLC). PUF samplers will be used during all excavation activities.

VOCs were not detected above the residential SRLs or laboratory RLs during the pre-design sampling; however, if volatile emissions are suspected based on flame ionization detector/PID results, or significant odor, additional air samples will be collected at all monitoring locations. Baseline air samples will be collected prior to excavation where VOCs are suspected. Air samples will be collected in SUMMA canisters over an 8-hour period or the duration of the work day and analyzed by EPA Compendium Method TO-15. All air samples will be submitted to a qualified ADHS-licensed laboratory for analysis.

If asbestos pipe is found at the Site, an abatement contractor will be required to perform air monitoring. This monitoring may be conducted using phase contrast microscopy methods.

All air monitoring results will be immediately documented and maintained onsite for the duration of the project. At a minimum, documentation will include equipment calibration data, background concentrations, date of monitoring, monitoring results, monitoring locations, source description, air temperature, relative humidity, and wind direction.

Lead Monitoring

A Miniram dust meter (PDM-3 or equivalent) sampler will be used to monitor dust levels during excavation at DU-1 and DU-3 where soil lead results were above the residential SRL. The average of the maximum lead concentrations at each of the borings (B-11, B-12, B-13, B-17, B-23, and B-24) within the DU-1 and DU-3 areas will be used to determine real-time dust levels. The six highest lead results had an average of 205.1 mg/kg lead in soil. Using 205.1 mg/kg of lead in soil and the NAAQS of 0.15 microgram per cubic meter of lead in soil corresponds to a dust limit of 731 micrograms per cubic meter in soil as total suspended particulates. Dust will be monitored during excavation of DU-1 and DU-3 to confirm lead is below the NAAQS.

7.4.8 Soil Segregating

This section provides a summary of waste characteristics from pre-design testing investigation sampling results, waste segregation and waste types, and a summary of soil segregation methods and field screening protocols to appropriately classify the excavated soil.

In April 2000, the U.S. Court of Appeals for the District of Columbia Circuit vacated the use of the hazardous waste toxicity characteristic for the evaluation of MGP waste. Therefore, MGP waste is not considered a hazardous waste unless it exhibits the characteristics of ignitability, corrosivity, or reactivity. This was confirmed by ADEQ in a letter to APS, dated April 16, 2001 (ADEQ, 2001) (**Appendix N**). Regardless of the regulatory definition, APS has elected to dispose of any soil exceeding the TCLP limits for hazardous waste of 0.5 mg/L benzene or 5 mg/L lead at a hazardous waste facility as a special waste PCS, in accordance with Arizona special waste generator and transportation requirements and using Arizona special waste manifests.

7.4.8.1 Summary of Waste Characteristics from Pre-Design Testing Investigation Sampling

Waste characterization data were collected during the pre-design testing investigation at locations anticipated to have the highest PAH results. These included samples collected at, but not limited to, the former gas holders, meter house, generator house, adjacent to the purifiers, and adjacent to previous sample location SS-5. Samples analyzed for waste characterization are presented in **Table 2-9**.

In addition to waste characterization samples, multiple soil samples were collected and analyzed for total VOCs and metals during previous site investigations and/or the pre-design testing investigation. The total concentrations of select metals were compared to the TCLP limits to evaluate the potential for waste generated from that area to exceed a TCLP limit. If the total concentration of a compound in the soil

exceeded the TCLP hazardous waste limit by 20 times or more, the soil is considered to have the potential to exceed the TCLP limit and may need to be disposed of as a hazardous waste.

Samples collected at B11-2.5-3.0 and B12-7.5-8.0 had lead results above the residential SRL of 400 mg/kg. These samples were analyzed for TCLP metals in addition to total metals to determine the leaching potential of soil of lead at the Site. The TCLP lead results for the samples above the residential SRL were 0.920 and 0.128 mg/L, below the TCLP hazardous waste toxicity characteristic of 5 mg/L for lead. All metals from the samples were below the hazardous waste toxicity characteristic. Based on TCLP lead results, no areas at the Site have been identified as requiring segregation due to a potential for exceeding the TCLP limits for lead (or other compounds). No areas at the Site have been identified as hazardous waste.

7.4.8.2 Waste Segregation and Waste Types

The goal of waste segregation is to effectively and efficiently identify and segregate excavated soil into one of the five site-specific waste classifications. In general, the majority of the excavated soil will meet the requirements to be classified as a special waste PCS and transported offsite to a licensed landfill.

For the purposes of waste classification at the Site, excavated soil will be segregated into the following five classifications:

- Non-impacted soil
- Construction debris
- ACM
- Special waste PCS
- Special waste PCS that exceeds 0.5 mg/L TCLP for benzene or 5 mg/L TCLP for lead

Non-impacted Soil

Non-impacted soil is soil that contains concentrations of indicator compounds below cleanup criteria, as described in Section 7.2. An example of non-impacted soil would be topsoil overlying impacted soil that does not contain MGP-related compounds. Soil that is classified as non-impacted may be used as backfill.

Construction Debris

Construction debris at the Site will consist of concrete slabs, abandoned pipe, steel, and possibly ACM if encountered (piping and building materials). This material, if visually free of contamination, with the exception of ACM, will be separated from the soil and disposed of, or recycled, at an approved facility. Construction debris that is not visually free of contaminants will be handled as an Arizona Special Waste and transported to an approved landfill for disposal.

Asbestos-Containing Material

Any ACM will be handled according to regulatory requirements by a licensed asbestos abatement contractor, as described in Section 7.3.2, and disposed of at an approved facility.

Special Waste PCS

Soil with concentrations of PAH compounds above non-residential SRLs will be classified as an Arizona special waste PCS. Special waste PCS will be transported offsite for disposal at a landfill licensed to receive special waste PCS. Soil with concentrations above residential SRLs, but below non-residential SRLs, can be classified as an Arizona Solid Waste PCS and transported offsite to a solid waste landfill in accordance with Arizona special waste requirements. However, because soil throughout most of the Site has exceeded non-residential SRLs, APS will likely dispose of all excavated soil exceeding residential or non-residential SRLs as special waste PCS.

Special Waste Soil that Exceeds 5 mg/L TCLP for Lead

Soil that exceeds 5 mg/L TCLP lead will be managed as a special waste PCS but will be segregated from the other soil and disposed of at a hazardous waste facility. Soil that has the potential to contain greater than 5 mg/L TCLP lead will be stored in roll-off containers separate from other wastes, pending analysis. Based on pre-design testing investigation sampling analytical data, including lead TCLP results from the two lead results above the residential SRL, no areas are anticipated to require segregation based on TCLP results less than 5 mg/L.

7.4.8.3 Methods of Soil Segregation

Soil segregation will occur through the use of several methods during remedial activities. To achieve the goals of the soil segregation process, the following soil segregation procedures will be used:

- Field evaluation of physical characteristics
- Direct-read field measurements
- Fixed-base laboratory prescreening
- TCLP determination for lead at a fixed-base laboratory

A flow chart for the segregation process is presented on **Figure 7-4**. The soil segregation process has been developed based on the results of previous investigations and the pre-design testing investigation results. The segregation process has been designed so that field staff will make the appropriate classification of excavated materials, while minimizing the generation of dust and odors and the addition of water to the soil.

Field Evaluation of Physical Characteristics

The APS consultant will preliminarily classify the physical characteristics of the soil using visual indicators. The presence of coal tar or lampblack and lead can be observed by a black or dark brown staining of the soil. Based on previous remediation at other MGP sites, the tar-impacted soil exhibits a very strong odor. Physical characteristic screening will be performed at a minimum sampling frequency of every 5 to 10 tons. During the pre-design testing investigation very little stained soil and/or odor was observed.

Direct-read Field Measurement

Field physical characteristics screening will be supplemented with field monitoring using direct-read instruments. Soil that is visibly stained will be tested by headspace analysis using an organic vapor analyzer or organic vapor monitor. Direct-read field measurements will be collected at a frequency of approximately every 30 to 50 tons. Headspace analysis will also be performed on a portion of the soil samples that do not appear to be visibly stained to support the identification of soil impacted by MGP-related compounds.

Fixed-Base Laboratory Prescreening

During soil remediation activities at the Site, the waste determination of excavated soil will need to be accurately and efficiently performed. The field method for waste determination of excavated soil may include the use of a fixed-base laboratory with a 24- to 48-hour turnaround time to determine the total concentrations of PAHs, and lead.

In accordance with EPA Test Method 1311, Section 1.2 for TCLP analysis, a total constituent analysis will be used to prescreen soil identified as potentially containing lead and/or benzene above TCLP limits to determine which soil will be further analyzed for TCLP lead. Composite samples will be collected from the excavated soil placed in roll-off containers and analyzed at a fixed-base laboratory for benzene and/or lead with a 24- to 48-hour turnaround-time. The total benzene and/or total lead concentration will be divided by 20 to calculate the maximum leachable concentration for unsaturated soil. Soil that has a calculated maximum leachable lead level of less than the regulatory lead level for toxicity characteristic for a hazardous waste (5 mg/L) will be classified as a special waste PCS.

Lead TCLP Confirmation at Fixed-Base Laboratory

If results from the fixed-base laboratory for total lead indicate that the soil potentially contains a concentration that may exceed the TCLP limit, a waste determination sample will be collected and submitted to a fixed-base laboratory for TCLP analysis. The TCLP analysis will be performed on a rush basis, and the results are anticipated to be received within approximately 3 to 5 days.

Based on the results of the TCLP analysis, the soil will be disposed of at a facility licensed to receive hazardous waste if concentrations exceed the TCLP level for any compounds or managed as a special waste PCS for disposal at a licensed landfill if the results do not exceed TCLP levels.

7.4.8.4 Onsite Storage and Handling

Soil will be segregated into roll-off containers or small stockpiles based on visual observations, odor, and PID readings. Stockpile volumes will coincide with the volume of material planned for offsite disposal on a daily basis. Non-impacted material will be placed outside the work area and may be used as backfill material at the completion of the excavation. Soil evaluated to be special waste PCS may be excavated and directly loaded into trucks. Excavated soil with the potential of exceeding 5 mg/L TCLP lead will be placed in lined roll-off containers. Any stockpiles, including debris, will be bermed and covered daily with 6-mil plastic sheeting to prevent air emissions and to control run-on/run-off in the storage area.

7.4.8.5 Load Out of Excavated Soil and Import of Borrow Fill

Special waste PCS will be direct loaded as the soil is excavated unless the soil has the potential to exceed a TCLP concentration for benzene or lead as described previously. The special waste PCS will be loaded in the trucks and hauled daily to a special waste landfill. The material to be disposed offsite will be weighed prior to entering the facility. The truck will then be weighed after dumping prior to leaving the facility. The gross, tare, and net weight will be recorded by the facility and submitted with the treatment/disposal invoice.

Borrow fill imported to the Site for backfill will be required to be weighed by the contractor as documentation for payment. The weight tickets from the waste and borrow fill hauling will be used to estimate the volume of material removed from the excavation.

Transportation of waste to offsite disposal facilities or transportation of imported borrow fill will be conducted on an approved haul route. Neither the disposal facilities (that is, the recycling facility, APS-approved local permitted solid waste landfill, special waste landfill, or EPA-permitted treatment, storage, and disposal facility) nor the borrow site have been determined for this project at the time of publication of this RAP. Therefore, the transportation routes for the borrow fill have not been established. Before transportation activities begin, a transportation plan that details the hauling routes for both offsite waste disposal and imported borrow fill will be submitted by APS to the City for approval. The objective of this plan is to control the transport of imported borrow fill and to control, transport, treat, and/or dispose of all materials according to the pertinent regulations and in an environmentally safe manner. All waste material will be controlled in strict compliance with federal, state, and local regulations, statutes, and ordinances.

Trucks used for the offsite transportation of contaminated soil and debris will remain outside of the excavation on clean areas at all times to minimize the need to decontaminate the truck tires. If necessary, the truck tires will be dry-decontaminated with brushes by the contractor prior to leaving the Site. During loading, dust and odor emissions will be monitored and mitigated as necessary, according to Section 7.4.7.1. The hauling truck trailers will be fully covered prior to leaving the Site. All special waste PCS will be manifested and transported to a special waste landfill, such as Waste Management Marana Regional Landfill. Material that exceeds 5 mg/L TCLP for lead will be trucked to an EPA-permitted treatment, storage, and disposal facility.

Each disposal facility will be required to submit a certified weight ticket for each load received from the Site. The facility will fax a load count to APS daily that includes the date and time the shipment arrived, the manifest number, the truck and trailer number, and weights for tracking purposes.

In the event of an emergency or spill during waste transportation, the driver of the waste hauling truck will use the following procedures:

- Park the vehicle in the most secure area available, away from homes, traffic, waterways, and businesses.
- Stay with the vehicle until appropriate support has arrived; move a safe distance away from the vehicle or spill material if imminent danger exists.
- Notify the appropriate emergency contacts. The following information should be available to the emergency contacts:
 - Location of accident/emergency
 - Quantity and type of spill
 - Nature and extent of injuries or property damage
 - Manifest number
 - Locations of nearby receptors, such as people and water channels
 - Contact number for the driver (that is, a cell phone or radio)

All truck drivers will be required to review, adhere to, and sign a Truck Driver Policy and Orientation procedure prior to working on the Site.

7.5 Sampling and Analysis Procedures

Detailed sampling procedures for soil, water, air, and waste, along with laboratory analytical methods and QA/QC procedures, are located in the QAPP (Jacobs, 2019c).

7.5.1 Verification Sampling

DUs were established for the Site to assist with confirmation of excavation extent. A DU is an area or volume that is defined according to the environmental concerns posed by the contaminants present and the intended use of the Site. A DU is implicit in grid sampling approaches using discrete samples. Considerations in identifying DUs for the Site included the following:

- Utility locations
- Site physical characteristics that could influence the distribution of contaminant
- Sampling and analytical results from Site investigations
- Site cleanup criteria
- Planned depths of excavation throughout the Site

After DUs are selected and excavated representative sampling methods are used to determine if soil is below residential SRLs. If results are below SRLs, area-wide contaminant concentrations (referred to as EPCs) are calculated across each DU for each COC. The EPCs are compared with applicable SRLs to make decisions regarding the need for any subsequent remedial action (that is, excavation) within that particular DU. Proposed DUs are shown on **Figure 7-1**.

7.5.1.1 Decision Unit Selection and Size

DU selection for the Site was based on a consideration of the relevant Site data and is defined as an area where a decision is to be made regarding remedial activities and the extent of excavation required in that area. The DUs were designed to logically divide the known or suspected areas of PAH contamination. A preliminary DU size of no larger than 0.25 acre (10,890 square feet) was targeted. Due to unknowns such as additional soil data generated during the remediation and potential changes to Site access from utilities, DU selection and size are subject to revision based on field conditions.

The Site was divided into four primary DUs, described as follows, based on four general excavation areas. Proposed excavation areas are shown on the proposed excavation plan on **Figure 7-1** and excavation depths within each DU area are shown on **Figure 7-2**. For each of the proposed DU areas, the bottom and the sidewall of the excavation will be managed as subsets of the main DU. The bottom of

the excavated DU area will be evaluated (such as DU-1B), where “B” denotes the base of the DU area, and the sidewall of the excavated DU area will be evaluated (such as DU-1S), where “S” denotes the sidewall of the excavated DU area.

- **DU-1** is located parallel to the gas line at the former southern gas holder, meter house, small purifiers, and northern gas holder. DU-1 will be excavated between 5 feet and 22 feet bgs. The excavation will remove half the southern gas holder foundation, the meter house and small purifiers subsurface foundations and the northern gas holder foundation. DU-1 was aligned parallel to the gas line to allow efficient soil removal in the vicinity of the gas line.
- **DU-2** is located at the former generator house. DU-2 will be excavated up to 10 feet bgs at the former generator house area. The excavation will remove the remaining generator house subsurface foundation and soil near the former oil sump location where PAH concentrations above the residential SRL were detected. Soil results from soil borings B-14, B-15, and B-16 at DU-2 were below the non-residential SRLs and may be transported as an Arizona solid waste PCS.
- **DU-3** will be excavated between 5 feet and 20 feet bgs at the former southern gas holder location and east of the small purifiers, parallel to the DU-1. The excavation will remove soil where concentrations of PAHs and lead were above the residential SRLs.
- **DU-4** is located along the northern border of the Site and south of the wash. Excavation of DU-4 will remove soil associated with SRL exceedances observed in borings B20 and B21 during the pre-design investigation.
- **DU-5** is located between DU-2 and DU-4. Because of the lack of soil data in the area between DU-2 and DU-4, test trenching at DU-5 will determine the general extent of the excavation area.

7.5.1.2 Sampling Frequency and Excavation Rationale

Excavation Bottom

A minimum of eight discrete soil samples will be collected from the bottom of each excavation DU. The EPC for each COC will be calculated at the DU bottom and will be calculated as the 95% UCL of the arithmetic mean concentration using EPA's ProUCL Version 5.1 statistical software package (EPA, 2015). No additional excavation will be necessary if the 95% UCL for the first set of samples is below the residential SRL for each COC. If the 95% UCL calculation result is above the residential SRL for any COC, the entire DU (the base) will be excavated further, and eight additional samples will be collected. A 95% UCL will be calculated for the new samples and compared to the residential SRL. Sampling and excavation will continue until the EPC is below the residential COC SRL.

Excavation Sidewall

The minimum number of samples collected from sidewall DUs will be based on the total unexcavated perimeter of the DU and the guidance provided in the Table 2 of the Wyoming Department of Environmental Quality VRP Fact Sheet 10, *Soil Confirmation Sampling Guidelines* (WDEQ, 2016), presented as follows:

| Total Linear Feet of Sidewalls | Number of Samples |
|--------------------------------|-------------------|
| $X < 100$ | 4 |
| $100 \leq X < 200$ | 5 |
| $200 \leq X < 300$ | 6 |
| $300 \leq X < 500$ | 7 |
| $500 \leq X$ | 8 |

A minimum of eight sidewall samples will be collected for statistical analysis. The EPC for each COC will be calculated at the DU sidewall and will be calculated as the 95% UCL of the arithmetic mean

concentration using EPA's ProUCL Version 5.1 statistical software package (EPA, 2015). No additional excavation will be necessary if the 95% UCL for the first set of sidewall samples is below the residential SRL for each COC. If the 95% UCL calculation result is above the residential SRL for any COC, the entire DU (the sidewalls) will be excavated further, and additional samples will be collected. A 95% UCL will be calculated for the additional set of samples and compared to the residential SRL. Sampling and excavation will continue until the EPC is below the residential SRL.

7.5.2 Soil Sampling Collection Methods

Soil samples will be collected using disposable scoops (where excavations can be accessed safely) or collected from an excavator bucket (where excavations cannot be accessed safely). The sampling method used will depend on the location of the sample, the depth of the excavation, and the type of sample required. This section describes each of the sampling methods that will be used.

7.5.2.1 Disposable Plastic or Stainless-Steel Scoop Samples

When bottom or sidewall samples are required, and safe access is available, disposable scoops will be used for sample collection into a laboratory-provided sample jar and submitted to the fixed-base laboratory. The following describes the sampling method:

- The sample will be collected using a disposable stainless-steel or plastic scoop and placed directly into a laboratory provided, certified, pre-cleaned 8-ounce (oz) jar.
- If VOC analysis is required, in-field methanol extraction will be used. The fixed-base laboratory will supply amber volatile organic analyte vials that contain a laboratory measured volume of methanol and dedicated laboratory provided sampling tee. Remove the lid from the amber vial and using the laboratory provided sample tee, collect the prescribed volume of soil, placing the soil in the vial using the sampling tee. Replace the lid and gently agitate the volatile organic analyte vial back and forth for approximately 10 seconds.

7.5.2.2 Backhoe Bucket and Auger Samples

During excavation activities if safe access to excavations is not possible a backhoe bucket may be used to collect verification soil samples. It also may be necessary to collect verification samples from a backhoe bucket or auger flights if the geometry of the excavation prohibits safe access of personnel. The following process describes the sampling technique to be used to collect backhoe bucket samples during the remedial activities:

- Collect soil samples from the backhoe bucket or auger flights using a disposable stainless-steel or plastic scoop. Place the soil directly into a pre-cleaned 8-oz sample jar.
- Use a laboratory provided methanol extraction kit for VOC sampling, if needed.
- Label each sample, log on a chain-of-custody form, and place on ice in a cooler or in a sample refrigerator and maintain at approximately 4 degrees Celsius (°C).

7.5.2.3 Stockpile or Roll-off Container Samples

When soil samples are to be collected from stockpile or roll-off containers, they will be collected as a composite sample. The composite sample will be composed of soil that is collected from a minimum of four separate locations in the stockpile or roll-off container.

- Collect an equal volume of soil from each of the stockpile or roll-off container sample locations using a disposable stainless-steel or plastic scoop and place directly into a pre-cleaned 8-oz jar.
- For stockpile and roll-off container samples, make a special note on the chain of custody to "thoroughly mix sample." This will notify the laboratory to homogenize the sample prior to extraction and analysis.

- When VOC analysis is required from a roll-off container sample, collect each sampling location individually. Notify the laboratory on the chain of custody to “composite all VOC samples” prior to analysis.
- Label the sample, log on a chain-of-custody form, and place on ice in a cooler or in a sample refrigerator and maintain at approximately 4°C.

7.5.3 Air Sampling Procedures

Baseline air samples will be collected from ambient air at each perimeter monitoring station prior to any excavation or remedial activities at the Site. The samples will be used to establish baseline concentrations of PAHs and dust in the ambient air. Baseline data will be obtained for PAHs using EPA Compendium Method TO-13A HPLC and dust using a Miniram dust meter. If VOC sampling is required, Compendium Method TO-15 will be used if needed.

7.5.3.1 High Volume Sampling

Continuous PAH air sampling during remedial activities will be conducted using HIVOL sampling as follows:

- If the HIVOL unit is not running (typically on Monday mornings), turn on the unit and allow it to warm up for 2 to 3 minutes before logging any information.
- If the HIVOL unit is running (Tuesday through Friday), record the final magnehelic, timer reading, and time, and then turn off the HIVOL unit.
- Remove the PUF tube and quartz filter from the HIVOL unit.
- Calibrate the airflow through the HIVOL unit per the manufacturer’s specifications.
- Put on a pair of powder-free nitrile gloves.
- Decontaminate all parts up-flow of the PUF tube using pesticide-grade hexane.
- Install a virgin PUF tube and quartz filter on the HIVOL unit.
- Turn on the HIVOL unit and record the magnehelic gauge reading, time, timer reading, and location in the logbook for calculation of the total flow volume through the sampler.
- Calculate the total flow volume and enter on the chain of custody.
- Ship the PUF tubes and quartz filters to the fixed-base laboratory within 24 hours.

7.5.3.2 Dust Sampling

Continuous dust air sampling will be conducted during all excavation activities at DU-1 and DU-3. Dust air sampling will be conducted using a Miniram dust meter (PDM-3 or equivalent) sampler.

- Record dust readings in the air sampling field logbook during excavation activities at regular intervals and at times of high winds.
- Calibrate Miniram dust meter (PDM-3 or equivalent) sampler per manufacturers specification.

7.5.3.3 SUMMA Canister Sampling

Previous Site investigations and the pre-design testing investigation indicate VOCs are not present at the Site and baseline SUMMA canister sampling is not anticipated. If VOCs are suspected at the time of excavation based on odor or PID direct field readings, air sampling using SUMMA canisters will be performed when VOCs are suspected to be present in the excavation. Six-liter SUMMA canisters would be used if needed to collect the samples for TO-15 analysis. The SUMMA canisters will be filled using a regulator calibrated by the fixed-base laboratory, allowing a constant flow of air into the canister during excavation activities. Both 8-hour and 12-hour regulators are available. The regulator used will depend on the length of time needed to handle the soil. If SUMMA canisters are required, baseline VOC sampling

will be conducted when excavation activities are not occurring. The sampling shall be carried out as follows:

- Attach the regulator to a 6-liter SUMMA canister.
- Place one SUMMA canister at each HIVOL sampling location approximately 4 feet off the ground and note the location in the logbook.
- Open the regulator and record the initial vacuum reading and start time.
- When the sampling period is over, record the final vacuum reading, close the regulator, and record the stop time.
- Remove the regulator.
- Secure the SUMMA canister with a brass or stainless-steel nut provided by the laboratory.
- Ship the SUMMA canisters to the fixed-base laboratory within 24 hours.

7.5.3.4 Direct-Read Instruments

Direct-read instruments will be used during the remedial activities to protect workers, check for hazardous environments, and screen soil samples. The equipment will include a PID and hydrogen sulfide, oxygen, carbon monoxide, and percent-lower explosive limit sensors. Calibration of these sensors will occur once per day when in regular use. Any instrument that exhibits erratic behavior will be field calibrated. Periodic cleaning of the PID lamp and use of water traps will prolong lamp and sensor life, as well as improve the accuracy of the readings. Detailed descriptions of the procedures and methods to use for direct-read instruments are located in the site-specific HASP.

7.5.4 Quality Assurance/Quality Control Sample Collection Procedures

In accordance with the QAPP (Jacobs, 2019c), QA/QC samples will be collected in the following manner:

- Collect field or rinsate blanks using distilled or deionized laboratory provided water. Collect the sample by pouring the water into the sample containers while onsite.
- Collect equipment blanks by pouring distilled or deionized water provided by the laboratory over the decontaminated sampling equipment (if disposable equipment is not used) or other sampling device and into the appropriate bottles.
- Collect soil and water blind field duplicate samples at a frequency of 1 duplicate sample per 10 samples to assess laboratory precision. Collect the duplicate samples following the same method described for the field samples.
- Provide appropriate sample volume to the laboratory to allow matrix spike/matrix spike duplicate analysis to be performed on all the verification samples. Confirm with the laboratory prior to sampling for laboratory specific requirements.

Trip blanks will be provided by the fixed-base laboratory and will accompany shipments of samples for VOC or BTEX analysis. Temperature blanks will accompany all environmental samples submitted to the laboratory for chemical analysis.

7.5.5 Fixed-base Laboratory Analyses

7.5.5.1 Soil Screening Analyses

A local ADHS-licensed fixed-base laboratory may be used for screening. The fixed-base laboratory would screen samples using the following methods:

- PAHs using EPA Method 8270C-SIM
- BTEX using EPA Method 8021B (if needed)
- VOCs using EPA Method 8260C (if needed)

- Lead using EPA Method 6020

7.5.5.2 Soil Verification Analyses

Verification analyses will be completed by an ADHS-licensed, fixed-base laboratory. The verification samples will be collected from the excavation bottom and perimeter sidewalls, as applicable, in areas that have been screened by the mobile or local fixed-base laboratory or that show no visual signs of impact from MGP-related compounds. The fixed-base laboratory would perform verification analysis using the following methods:

- PAHs using EPA Method 8270C-SIM
- Lead using EPA Method 6020 (DU-1 and DU-3 where elevated lead results were reported)

7.5.5.3 Air Sampling Analyses

Throughout the remediation activities, various air samples will be collected. The types of materials encountered will dictate the analyses performed on these samples. Air samples may be submitted to the ADHS-licensed, fixed-base laboratory for analyses of PAHs using EPA Compendium Method TO-13A.

7.5.5.4 Waste Characterization Analyses

In addition to verification sampling, soil samples will be submitted to the fixed-base laboratory for waste characterization to ensure the proper handling of waste material. Depending on the sample location and former analytical results, some or all of the following analyses will be used for waste characterization:

- PAHs using EPA 8270C-SIM
- Totals RCRA 8 Metals (arsenic, barium, cadmium, chromium, lead, mercury, selenium, and silver) using EPA Method 6010B/7170A
- Total VOCs using EPA GC Method 8021B or GC/MS Method 8260B
- TPH using ADHS Method 8015AZR1
- PCB using EPA 8082
- TCLP VOCs using EPA Method 1311/8021B or 8260B (if required)
- TCLP RCRA 8 Metals (arsenic, barium, cadmium, chromium, lead, mercury, selenium, and silver) using EPA Method 1311/6010C/7471A (if required)
- Paint filter using EPA Method 9095
- Ignitability as defined in SW-846 Chapter 7.1.2
- pH using EPA Method 9045B (soil containing free liquids)
- Total cyanide using EPA Method 9014

If the constituents analyzed for total VOCs or metals meet or exceed 20 times the RCRA characteristics levels, then TCLP VOCs or metals will be analyzed.

7.5.6 Data Verification and Data Validation

Data verification and data validation will be performed throughout the project on the analytical data reported by the laboratories. Data verification and data validation will be used to ensure, through examination and objective evidence, that data are of sufficient quality to support decisions based on data quality objectives (DQOs) presented herein and in the QAPP (Jacobs, 2019c). Data verification will be used to evaluate the data for completeness, correctness, and conformance according to the method, procedural, and/or contractual requirements between the laboratory and APS. Data validation is an analyte-specific and sample-specific data evaluation process used to confirm that particular requirements for the specific intended use of the data are met.

The project chemist will be responsible for oversight of the data verification and validation effort. Data verification and validation will be performed in accordance with the ADEQ data verification and data validation checklists included in the QAPP and will follow the QA/QC documentation outlined in the EPA Region 9 *Laboratory Documentation Required for Data Evaluation R9QA/00*, dated August 2001 (EPA, 2001b). The use of these checklists and appropriate laboratory documentation will standardize the data verification and validation process and minimize any discrepancy that may result between different data validators. A level III data validation will be performed on soil confirmation sampling and air as described in the QAPP.

Data validation will be carried out when the data packages are received from the laboratory and will be performed per analytical batch using the summary results of calibration and laboratory QA/QC, as well as those of the associated field samples. Data validation procedures will include the following:

- Review of the data package for completeness
- Review of chain-of-custody records for discrepancies that might impact data quality
- Review for compliance with holding time and QC frequency requirements
- Evaluation of all calibration and QC summary results against the project requirements
- Qualification of the data using appropriate qualifier flags, as necessary, to reflect data usability limitations
- Initiation of corrective actions, as necessary, based on the data review findings

DQOs will be used as a guide for data validation. The examination will focus on validating the degree to which the DQOs have been achieved, particularly the QA/QC analytical results. The DQO guidelines allow for assessment of the confidence in the soil, air, and groundwater sample data sets. The DQOs are precision, accuracy, representativeness, completeness, and comparability, and represent qualitative and quantitative objectives that ensure the data generated during this investigation meet the needs of the project. For this project, the DQOs are defined as follows:

- **Precision** is a measure of the reproducibility of concentrations reported for duplicate soil and groundwater samples collected from the same location. Precision is calculated by determining the relative percent difference (RPD) between duplicate samples. The proposed precision objective for groundwater is an RPD of 20 percent for field duplicates. The proposed precision objective for soil is an RPD of 35 percent for field duplicates.
- **Accuracy** is the degree to which the measurement data approaches the “true” value for each analyte. For soil samples, accuracy is assessed by calculating the percent recovery for a sample spiked with the analyte of concern (matrix spike). For soil, air, and groundwater samples, the accuracy objective will vary by analysis and compound. The accuracy objectives for this project are presented in Tables 3-4 through 3-6 in the QAPP for APS Arizona MGP sites (Jacobs, 2019c).
- **Representativeness** refers to the comparability of the sample collection procedures to those delineated in the RAP and to the degree which the analytical data represent the subsurface contaminant concentrations. Representativeness will be accomplished by using consistent field sampling and analytical procedures for soil, air, and groundwater samples.
- **Completeness** is defined as the ratio of acceptable validated laboratory measurements to the total number of planned measurements for this investigation. The completeness objective for the soil, air, and groundwater samples collected during this investigation is at least 90 percent.
- **Comparability** is an evaluation of the relative consistency of the laboratory measurement data. Because comparability cannot be measured quantitatively, professional judgment is relied upon. Internal comparability will be achieved for soil by adhering to consistent sample collection procedures and analyses methods throughout the remediation.

7.6 Site Restoration and Post-Remediation Activities

Site restoration and post-remediation activities include backfilling and restoring the Site, demobilization, post-closure monitoring, and preparation of a report documenting the remediation activities.

7.6.1 Excavation Backfilling

The contractor will be responsible for identifying an offsite source of suitable fill material that is free of contamination. Prior to beginning excavation activities, APS will review and approve the import source of clean fill. The soil proposed for use as backfill at the Site will be sampled and analyzed to confirm that it does not contain COCs associated with the Site or other likely contaminants. The potential backfill will be sampled and analyzed for the following constituents:

- PAHs using EPA Method 8270C-SIM
- PCBs using EPA Method 8082
- Pesticides using EPA Method 8081A or 8081B
- Herbicides using EPA Method 8151A
- Total VOCs using EPA GC Method 8021B or GC/MS Method 8260B
- TPH using ADHS Method 8015AZR1
- Total Metals using EPA Method 6010B/7170A

The soil will be considered acceptable for use as backfill if concentrations of the listed analytes, except for metals, are not detected above the RLs listed in the QAPP (Jacobs, 2019c). Metals concentrations must be within the ranges identified in the Evaluation of Background Metal Concentrations in Arizona Soil (ADEQ, 1991) and below the residential SRLs and GPLs.

Upon approval, the contractor will schedule delivery of the import material to the Site for backfill purposes. APS will require the contractor to periodically collect soil samples from the import source and submit samples to a fixed-base laboratory for analysis. Approximately 12 samples will be collected for the first 5,000 cubic yards of fill material and one sample for each additional 1,000 cubic yards (DTSC, 2001). The constituents analyzed and sample frequency may be adjusted based on the source of the backfill (that is, existing commercial gravel pits). The location from which the backfill originates will be documented in the Site logbook.

The contractor will backfill the excavation areas as soon as practical to limit the amount of open excavation. The excavation can be backfilled only after confirmation sampling, as described in Section 7.5.1.2, verifies that Site cleanup criteria have been met. The backfilled area will be approximately the same elevation as the existing topography in accordance with the City-approved grading plan. The Site surface will be covered with aggregate base rock to control dust and erosion.

7.6.2 Demobilization

Following the completion of remedial activities, the contractor will demobilize from the Site. The following activities will be performed as part of demobilization:

- Removal of construction trailer(s) and supporting structures (electric, communication, and similar) from the Site
- Removal of the Site security fence
- Demobilization of excavation and material processing equipment, decontamination equipment, safety equipment, sampling equipment, and monitoring equipment

Performance of a final review of the work and the Site, which will include a meeting between the contractor, Jacobs, and APS to assess the scope of work and identify and resolve any potential conflicts or questions that may remain.

7.6.3 Reporting

A report will be prepared to document the remedial activities conducted at the Site. The report will include, but will not be limited to, the following:

- Detailed description of the volume of soil that was excavated
- Disposition of the soil and other wastes (that is, decontamination water)
- Excavation backfilling and Site restoration activities
- Sampling location maps
- Analytical data from verification sampling
- Data validation reports
- Waste manifests, bills of lading, and certificates of destruction for wastes
- Copies of all applicable permits that were obtained
- Copies of discharge and other reports generated during the remedial activities
- Documentation of sample collection methods, soil segregation procedures, dewatering activities, if any
- Discussion regarding the cleanup criteria, describing areas in which the criteria were not met, if any, and additional recommendations if cleanup criteria were not met
- Documentation of discussions and/or agreements with regulatory agencies including ADEQ and the City
- Documentation of community involvement during public outreach activities

7.7 Site Remediation Schedule

The schedule for major site remediation activities is anticipated as follows:

- ADEQ Approval of RAP – January/February 2020
- Preparation of Remedial Design – January/February 2020
- Community Involvement and Public Comment Period – February/March 2020
- Remedial Construction – March through August 2020
- Closure Report – October 2020

Tables

Table 1-1. Summary of Operational History
APS Douglas Former MGP Site, Douglas, Arizona

| Year | Site Structure | Site Activities |
|-----------|--|--|
| 1905-1908 | No information available. | Manufactured gas operations began between 1905 and 1908 and continued until the 1930s ¹ . |
| 1929 | Generator house, one large purifier, two small purifiers, a meter house, a steel crude oil tank, two gas holders, and a concrete shed ² . | Manufactured gas operations continued at the site ^{1,2} |
| 1930 | Generator house, one large purifier, two small purifiers, a meter house, a steel crude oil tank, two gas holders, and a concrete shed ² . | Arizona Edison Company controlled by Peoples Light and Power Corporation. Annual Production 51.5377 million cubic feet and annual sales 43.9241 million cubic feet ⁴ . |
| 1938 | Generator house, one large purifier, two small purifiers, a meter house, a steel crude oil tank, two gas holders, and a concrete shed ² . | Arizona Edison Company (natural) Natural gas purchased from El Paso Natural Gas Company for resale. Annual sales 115.9389 million cubic feet ⁴ . Supplies Douglas. |
| 1940 | Generator house, one large purifier, two small purifiers, a meter house, a steel crude oil tank, two gas holders, and a concrete shed ² . | Arizona Edison Company Inc. natural gas purchased from El Paso Natural Gas Company for resale. Annual sales 135.4454 million cubic feet ⁴ . Supplies Douglas. |
| 1944-1947 | Concrete shed, large purifier, and possibly the meter house ^{1,2} . Remaining site structures are not indicated on the 1947 Sanborn map. | Manufactured gas operations were discontinued prior to 1947. Annual gas production ranged from 13.7 million cubic feet in 1910 to 51.5 million cubic feet in 1930 ^{1,4} . |
| 1945 | Concrete shed, large purifier, and possibly the meter house ^{1,2} . | Arizona Edison Company Inc. natural gas purchased from El Paso Natural Gas Company for resale. Annual sales 215.9795 million cubic feet ⁴ . Supplies Douglas. |
| 1950 | Concrete shed, large purifier, and possibly the meter house ^{1,2} . | Arizona Edison Company Inc. natural gas purchased from El Paso Natural Gas Company for resale. Annual sales 584.7239 million cubic feet ⁴ . Supplies Douglas. |
| 1995 | Concrete shed, large purifier, concrete foundations from the two gas holders and generator house, and a 2-foot-deep sump associated with the steel crude oil tank. | Site investigation performed from October 1995 to June 1996. The contents of the oil sump and debris from the purifier were characterized in addition to surface and subsurface soil samples ¹ . |
| 1996 | Oil sump contents and sump; purifier contents and purifier; debris pile; concrete shed; and surface soil. Concrete foundations of two gas holders, two purifiers, meter house, and generator house. | Materials removed from site base on Arcadis/Geraghty & Miller, <i>Material Removal Activities Former Manufactured Gas Plant, Douglas, Arizona</i> (June 5, 1998) ³ . Materials remaining onsite ³ . |
| 1998 | Concrete foundations of the following: two gas holders, two purifiers, a meter house, and a generator house. | Arcadis/Geraghty & Miller, <i>Material Removal Activities Former Manufactured Gas Plant, Douglas, Arizona</i> (June 5, 1998) ³ . |

Notes:

Notes:

¹ ft bgs = feet below ground surface

² mg/kg = milligram(s) per kilogram

³ Residential SRLs represent the value for 10⁻⁵ carcinogenic risk for compounds identified as carcinogens in Appendix A of Title 18, Chapter 7.

⁴ Cells highlighted in yellow indicate that the compound exceeded the 2007 residential soil remediation level (SRL).

⁵ Cells highlighted in red indicate the compound exceeded the 2007 non-residential SRL.

⁶ NE = Standard not established

⁷ -- = Sample not analyzed for this compound

U = The analyte was analyzed for, but was not detected above, the reported sample quantitation limit.

UJ = The analyte was analyzed for, but was not detected above, the reported sample quantitation limit. However, the reported quantitation limit is approximate and may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

D = Sample was diluted for analysis

Notes:

¹ ft bgs = feet below ground surface

² mg/kg = milligram(s) per kilogram

³ -- = Sample not analyzed for this compound

⁴ Sludge sample was collected for waste disposal purposes. Metals reported in milligrams per liter; benzene, toluene, ethylbenzene, and xylene reported in micrograms per liter

⁵ Sampling location indicates area surrounding former October 1995 sampling Location (SS-x) where composite sample was collected.

⁶ Composite sample from areas surrounding SS-4 and SS-7

⁷ Composite sample from areas surrounding SS-11 and S-S12

⁸ Sample COMP is a composite sample of samples collected at the Site on 6/1/1996

U = The analyte was analyzed for, but was not detected above, the reported sample quantitation limit.

UJ = The analyte was analyzed for but was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

Notes:

¹ ft bgs = feet below ground surface

² mg/kg = milligram(s) per kilogram

³ Cells highlighted in yellow indicate that the compound exceeded the 2007 residential soil remediation level (SRL).

⁴ Cells highlighted in red indicate the compound exceeded the 2007 non-residential SRL.

⁵ Sludge sample was collected for waste disposal purposes. Benzene, toluene, ethylbenzene, and xylene reported in micrograms per liter. VOCs were analyzed for and not detected in the Sludge sample.

⁶ Sampling location indicates area surrounding former October 1995 sampling Location (SS-x) where composite sample was collected.

⁷ Composite sample from areas surrounding SS-4 and SS-7

⁸ Composite sample from areas surrounding SS-11 and S-S12

⁹ Sample COMP is a composite sample of samples collected at the Site on 6/1/1996

-- = Sample not analyzed for this compound

U = The analyte was analyzed for, but was not detected above, the reported sample quantitation limit.

UJ = The analyte was analyzed for, but was not detected above, the reported sample quantitation limit.

However, the reported quantitation limit is approximate and may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

Notes:

¹ ft bgs = feet below ground surface

² mg/kg = milligram(s) per kilogram

³ Cells highlighted in yellow indicate that the compound exceeded the 2007 residential soil remediation level (SRL).

⁴ Cells highlighted in red indicate the compound exceeded the 2007 non-residential SRL.

⁵ -- = Sample not analyzed for this compound.

⁶ Sludge sample was collected for waste disposal purposes. Metals reported in milligrams per liter.

⁷ Sampling location indicates area surrounding former October 1995 sampling Location (SS-x) where composite sample was collected. Results presented as total metals/TCLP metals.

⁸ Composite sample from areas surrounding SS-4 and SS-7

⁹ Composite sample from areas surrounding SS-11 and S-S12

¹⁰ Sample COMP is a composite sample of samples collected at the Site on 6/1/1996

U = The analyte was analyzed for, but was not detected above, the reported sample quantitation limit.

UJ = The analyte was analyzed for, but was not detected above, the reported sample quantitation limit. However, the reported quantitation limit is approximate and may not represent the actual limit of quantitation

T = toxicity characteristic leaching procedure (TCLP) used

| Sample Location | Drilling Method | Sample Date | Sample Location | Sample Depth (ft bgs) | Reference |
|-----------------|--------------------------|-------------|---|-------------------------------|---|
| SB-1 | Hollow Stem Auger Boring | 10/25/1995 | West of generator house | 4.5 to 6; 9 to 10.5 | 1996 Site Investigation (Geraghty & Miller, 1997) |
| SB-2 | Hollow Stem Auger Boring | 10/26/1995 | North of south gas holder near meter house | 9 to 10.5 | 1996 Site Investigation (Geraghty & Miller, 1997) |
| SB-3 | Hollow Stem Auger Boring | 10/26/1995 | Southeast of the north gas holder | 9 to 10.5 | 1996 Site Investigation (Geraghty & Miller, 1997) |
| SB-4 | Hollow Stem Auger Boring | 10/25/1995 | West of the north gas holder near small purifiers | 0 to 1.5; 3 to 4.5; 9 to 10.5 | 1996 Site Investigation (Geraghty & Miller, 1997) |
| SB-5 | Hollow Stem Auger Boring | 10/25/1995 | North of the former generator house | 9 to 10.5 | 1996 Site Investigation (Geraghty & Miller, 1997) |
| SB-6 | Hollow Stem Auger Boring | 10/25/1995 | West of the oil sump | 9 to 10.5; 15 to 16.5 | 1996 Site Investigation (Geraghty & Miller, 1997) |
| SB-7 | Hollow Stem Auger Boring | 10/25/1995 | Between oil sump and large purifier | 10 to 11.5 | 1996 Site Investigation (Geraghty & Miller, 1997) |
| SB-8 | Hollow Stem Auger Boring | 10/25/1995 | South of former generator house | 9 to 10; 20 to 21.5 | 1996 Site Investigation (Geraghty & Miller, 1997) |
| SB-9 | Hollow Stem Auger Boring | 10/26/1995 | Debris and cinder pile | 3 to 4; 9 to 10.5; 15 to 16.5 | 1996 Site Investigation (Geraghty & Miller, 1997) |
| SB-10 | Hollow Stem Auger Boring | 10/26/1995 | West of debris pile | 9 to 10.5 | 1996 Site Investigation (Geraghty & Miller, 1997) |

Notes:

ft bgs = feet below ground surface

Table 2-1. Soil Boring Locations During Pre-design Testing Investigation
APS Douglas Former MGP Site, Douglas, Arizona

| Location ID | Drilling Method | Total Depth of Boring (feet below ground surface) | Sample Location | Lab Analyses | Purpose |
|-------------|-----------------------------|---|--|--------------------|---|
| B-11 | Hollow Stem Auger Boring | 20 | Gas Holder | PAHs, Metals, VOCs | Evaluate vertical extent of contamination under a former gas holder |
| B-12 | Hollow Stem Auger Boring | 25 | Gas Holder | PAHs, Metals, VOCs | Evaluate vertical extent of contamination under a former gas holder |
| B-13 | Hollow Stem Auger Boring | 20 | Meter House | PAHs, Metals, VOCs | Evaluate vertical extent of contamination under former meter house |
| B-14 | Hollow Stem Auger Boring | 20 | Generator House | PAHs, Metals, VOCs | Evaluate vertical extent of contamination under east end of former generator house |
| B-15 | Hollow Stem Auger Boring | 15 | Generator House | PAHs, Metals, VOCs | Evaluate vertical extent of contamination under north end of former generator house |
| B-16 | Hollow Stem Auger Boring | 20 | Oil Sump | PAHs, Metals, VOCs | Evaluate vertical extent of contamination under former oil sump |
| B-17 | Hollow Stem Auger Boring | 20 | Purifiers and PURS32/PURS42 location | PAHs, Metals, VOCs | Evaluate vertical extent of contamination west of former purifiers |
| B-18 | Hollow Stem Auger Boring | 15.5 | Off Site | PAHs, Metals | Evaluate vertical and horizontal extent of contamination northeast of the Site ¹ |
| B-19 | Hollow Stem Auger Boring | 20 | Debris Pile | PAHs, Metals, VOCs | Evaluate the vertical extent of contamination at the former debris pile |
| B-20 | Hollow Stem Auger Boring | 20 | North of Debris Pile | PAHs, Metals | Evaluate the vertical and horizontal extent of contamination north of the former debris pile |
| B-21 | Hollow Stem Auger Boring | 25 | North of Previous Investigation SS-5 Location | PAHs, Metals, VOCs | Evaluate lateral and vertical extent of contamination north of SS-5 location |
| B-22 | Hollow Stem Auger Boring | 15.5 | South of Previous Investigation SS- 10 Location | PAHs, Metals | Evaluate lateral and vertical extent of contamination south of SS-10 location |
| B-23 | Hollow Stem Auger Boring | 20 | North of Gas Holders east of SS-14 location | PAHs, Metals | Evaluate vertical and lateral extent of contamination north of the former gas holders |
| B-24 | Hollow Stem Auger Boring | 20 | Purifiers | PAHs, Metals | Evaluate vertical and horizontal extent of contamination east of former purifiers |
| B-25* | Sonic Core Barrel Boring | 50 | Southwest of Debris Pile | PAHs, Metals, VOCs | Evaluate the lateral extent of contamination and groundwater near the western site extent ² |
| B-26* | Sonic Core Barrel Boring | 50 | South of the Gas Holders | PAHs, Metals | Evaluate the lateral extent of contamination and groundwater near the southern site extent |
| B-27* | Sonic Core Barrel Boring | 50 | Off Site Southwest of Site | PAHs, Metals | Evaluate background metals and groundwater southwest of the Site |
| B-28 | Hollow Stem Auger Boring | 20 | Off Site Southwest of Site | PAHs, Metals, VOCs | Evaluate background metals southwest of the Site |
| B-29 | Hollow Stem Auger Boring | 21 | Off Site South of Site | PAHs, Metals, VOCs | Evaluate the lateral extent of contamination and background metals south of the Site |
| B-30 | Hollow Stem Auger Boring | 20 | Off Site Northeast of Site | PAHs, Metals, VOCs | Evaluate background metals northeast of the Site |
| B-31 | Hollow Stem Auger Boring | 21 | Off Site North of Site | PAHs, Metals | Evaluate background metals north of the Site |
| B-32 | Hollow Stem Auger Boring | 21 | Off Site North of Site | PAHs, Metals | Evaluate background metals north of the Site |
| B-33 | Hollow Stem Auger Boring | 21 | Off Site North of Site | PAHs, Metals | Evaluate background metals north of the Site |
| B-34 | Hollow Stem Auger Boring | 21 | Off Site Northwest of Site | PAHs, Metals | Evaluate background metals northwest of the Site |
| B-35 | Hollow Stem Auger Boring | 21 | Off Site West of Site | PAHs, Metals, VOCs | Evaluate background metals west of the Site ³ |

Notes:

¹ This location was moved in the field due to overhead power lines.

² This location was moved in the field off private property onto City of Douglas property.

³ This location was moved in the field to prevent drilling in the wash.

* Borings B-25, B-26, and B-27 also included water analyses for PAHs, metals, and VOCs
Lab Analyses listed in this table do not include waste characterization.

Table 2-2. Summary of Geotechnical Results
APS Douglas Former MGP Site, Douglas, Arizona

| Boring | Sample Depth (ft bgs) | Dry Density (pcf) | Moisture Content (%) | Specific Gravity | Percent Passing No. 200 (%) | Atterberg Limits | | | Undrained Shear Strength | | USCS Classification | FOC (D2974) |

Notes:

USCS Classification Codes

foc = fraction of organic carbon; analyzed by Xenco Laboratories

CL = lean, sandy, or silty clays

SC = sandy clays

SM = sandy silt

- = test not analyzed

For Shear Strength: T= Total, E= Effective

ft bgs = feet below ground surface

pcf = pounds per cubic foot

Table 2-3. Summary of Analytical Data for Soil PAHs
APS Douglas Former MGP Site, Douglas, Arizona

U = Analyte was not detected at the specified detection limit.
UJ = Analyte was not detected at the specified detection limit, detection limit is estimated.
ft bgs = foot (feet) below ground surface
ID = identification number
mg/kg = milligram(s) per kilogram
Groundwater protection levels are site specific (see text Section 4)

Table 2-4. Summary of Analytical Data for Soil Metals
 APS Douglas Former MGP Site, Douglas, Arizona

| Location | Sample ID | Sample Depth (ft bgs) | Sample Date | Units | Arsenic | Barium | Cadmium | Chromium | Lead | Mercury | Selenium | Silver |

Notes:

Cells highlighted in red indicate that the compound exceeded the Residential Soil Remediation Level and Non-Residential Soil Remediation Level.

Cells highlighted in yellow indicate that the compound exceeded the Residential Soil Remediation Level only.

Cells highlighted in blue indicate that the compound exceeded the minimum Groundwater Protection Level and Residential Soil Remediation Level.

Detected results are shown in **Bold**.

Groundwater Protection Levels are the minimum values from Table 4 of ADEQ (1996). A site-specific groundwater protection level was calculated for lead (refer to Section 4).

J = Analyte is present but the reported value might not be accurate or precise (estimate).

U = Analyte was not detected at the specified detection limit.

UJ = Analyte was not detected at the specified detection limit, detection limit is estimated.

ft bgs = foot (feet) below ground surface

ID = identification number

mg/kg = milligram(s) per kilogram

Table 2-5. Summary of Analytical Data for Soil VOCs

Notes:
Cells highlighted in red indicate the compound exceeded the Residential and Non-Residential Soil Remediation Level.
Cells highlighted in yellow indicate that the compound exceeded the Residential Soil Remediation Level only.
Detected results are shown in **Bold**.
J = Analyte is present but the reported value might not be accurate or precise (estimate).
U = Analyte was not detected at the specified detection limit.
UJ = Analyte was not detected at the specified detection limit, detection limit is estimated.
ft bgs = foot (feet) below ground surface
ID = identification number
mg/kg = milligram(s) per kilogram
Groundwater Protection Levels are the minimum values from ADEQ (2013)

Table 2-6. Summary of Analytical Data for Groundwater PAHs

Notes:

Detected results are shown in **Bold**.

Cells highlighted in yellow indicate that the compound exceeded the Residential Soil Remediation Level only.

Cells highlighted in red indicate that the compound exceeded the Non-residential Soil Remediation Level only.

J = Analyte is present but the reported value might not be accurate or precise (estimate).

U = Analyte was not detected at the specified detection limit.

UJ = Analyte was not detected at the specified detection limit, detection limit is estimated.

ft bgs = foot (feet) below ground surface

ID = identification number

mg/kg = milligram(s) per kilogram

mg/L = milligram(s) per liter

* = Locations added to waste characterization results due to total lead results above the residential SRL of 400 mg/kg; all TCLP results were below the toxicity characteristics.

PCB = polychlorinated biphenyl

TCLP = toxicity characteristic leaching procedure

VOC = volatile organic hydrocarbon

PAH = polynuclear aromatic hydrocarbon

Notes:

Cells highlighted in yellow indicate that the compound exceeded the Residential Soil Remediation Level only.

Detected results are shown in **Bold**.

U = Analyte was not detected at the specified detection limit.

* = Locations added to waste characterization results due to total lead results above the residential SRL of 400 mg/kg;

all TCLP results were below the toxicity characteristics.

ft bgs = foot (feet) below ground surface

ID = identification number

mg/L = milligram(s) per liter

PCB = polychlorinated biphenyl

PAH = polynuclear aromatic hydrocarbon

TCLP = toxicity characteristic leaching procedure

VOC = volatile organic compound

Table 5-1. Groundwater Protection Modeling Results for PAHs*APS Douglas Former MGP Site, Douglas, Arizona*

| Analyte | Calculated GPL (mg/kg) |
|-------------------------|------------------------|
| Acenaphthene | 9.03E+04 |
| Acenaphthylene | 2.91E+04 |
| Anthracene | 7.96E+08 |
| Benzo(a)anthracene | 4.85E+25 |
| Benzo(a)pyrene | 6.58E+84 |
| Benzo(b)fluoranthene | 2.44E+84 |
| Benzo(k)fluoranthene | 9.87E+82 |
| Chrysene | 8.46E+58 |
| Dibenz(a,h)anthracene | 1.23E+251 |
| Fluoranthene | 6.67E+12 |
| Fluorene | 2.82E+06 |
| Indeno(1,2,3-c,d)pyrene | Not Calculated |
| Naphthalene | 1.13E+02 |
| Pyrene | 6.93E+19 |

Notes:

The minimum GPL for indeno(1,2,3-c,d)pyrene could not be calculated because the estimated maximum soil concentration was too low

Calculated GPLs are based on the 2013 ADEQ GPL model spreadsheet. Calculation Spreadsheets are provided in Appendix K

GPL = groundwater protection level

mg/kg = milligram(s) per kilogram

Table 6-1. MGP Site Remediation: Feasibility Screening Matrix for Soil Remediation Options
APS Douglas Former MGP Site, Douglas, Arizona

| Remediation Options | Method Description | Applicability to Douglas MGP Site | Advantages | Limitations |
|--|--|--|--|---|
| 1. No Action | No active remediation activities. Relies on continues existing biological activities | Naturally degrade or degrade very slowly. Will not meet Soil Remediation Levels (SRLs). Does not reduce onsite risk. Does not prevent the potential pathway of contamination from soil to groundwater. | <ul style="list-style-type: none">Low cost | <ul style="list-style-type: none">Would likely require institutional controls that would limit future use of the site.Would require significant future soil samplingWould not likely meet regulatory requirements |
| 2. Institutional Controls (ICs) | Administrative land use controls (LUCs), Site access restrictions, and other restrictions to minimize potential exposure from Site contaminants | No – It does not meet SRLs and is not applicable due to 3 rd party ownership objection to DEUR. | <ul style="list-style-type: none">Low cost | <ul style="list-style-type: none">Continued monitoring of ICs would be required to verify their continued effectiveness and ensure that the exposure pathways are being controlled.Difficult to implemented as APS does not control site.ICs would limit the Cities use of the site. |
| 3. Excavation and Off-Site Removal | Remove and treat excavated impacted soils on site. Treat or dispose of soils on or offsite. | Yes – impacted soil can be removed by excavating a portion of the site. | <ul style="list-style-type: none">Protective of human health and then environment.Proven technology to address soil contaminationWill meet cleanup objectives, regulatory supportFew limitations on future site use | <ul style="list-style-type: none">Soils that are not feasible for removal (i.e., under structures) will remain in place require future actionExisting onsite utilities need to be maintained during remediation increasing risk from excavationExcavated soil treatment options are limited to offsite disposalVery high cost – requires significant excavation system to protect buildings and utilities. Significant disposal and site restoration cost. |
| 4. Containment by Capping and Institutional Controls | Use physical barrier, (i.e. surface cap) to limit exposure to contaminated soils. Capping materials can include geotextiles, soil, asphalt, or other materials. Includes administrative land use controls (LUCs), Site access restrictions, and other restrictions to minimize potential exposure from Site contaminants | No – It does not meet SRLs and is not applicable due to 3 rd party ownership objection to DEUR. | <ul style="list-style-type: none">Protective of human health and environment. | <ul style="list-style-type: none">Does not remove the contamination, so that contamination will remain, and potential to be a continuing liability.Continued monitoring of ICs would be required to verify their continued effectiveness and ensure that the exposure pathways are being controlled.Difficult to implemented as APS does not control site.Limits on use of the site would likely not be acceptable to the City |
| 5. In Situ Chemical Oxidization (ISCO) | Mineralizes contaminants in place through the addition of a chemical oxidant such as hydrogen peroxide or sodium persulfate. | Limited – applicable with standard chemical delivery systems since the target soils are unsaturated. Will not be able to Meet SRL's. Will likely not be effective on shallow lampblack materials. | <ul style="list-style-type: none">Should result in destruction of some of the contamination although not effective on near surface lampblack materials. | <ul style="list-style-type: none">Will not meet residential SRLs and RAOs.Laboratory testing required to determine the required dose and extent of destruction that can be achieved.Ozone highly corrosive to existing utilities.Soil vapor extraction required to control and monitor system. Additional permitting required.Mixing approach is relatively messy.Cost may be relatively high.Highly disruptive to site use for an extended period of time. |
| 6. Bioventing | Biological activity would be enhanced through the introduction of atmospheric oxygen. | Limited to the lighter molecular weight poly aromatic hydrocarbons (PAHs) and total petroleum hydrocarbons (TPH). | <ul style="list-style-type: none">Easy to implement.Relatively low cost.Minimal disturbance to site during operation | <ul style="list-style-type: none">Will not meet residential SRLs and RAOs.Not applicable for soils with lampblackLimited biodegradability of the high molecular weight PAHs.May take a number of years to complete and would limit Cities use of site during that time.. |

Table 6-2. MGP Site Remediation: Feasibility Screening Matrix for Treatment Options
APS Douglas Former MGP Site, Douglas, Arizona

| Treatment options | Method description | Applicability to APS Douglas MGP | Advantages | Limitations |
|---|---|--|--|--|
| 1. Landfill | Haul excavated soil to landfill for disposal, backfill with imported clean soil | Yes – can landfill special waste at local landfill, high transportation cost | <ul style="list-style-type: none">• Can be cost effective if appropriate landfill can be identified | <ul style="list-style-type: none">• Non hazardous soil only• Liability tied to landfill• Backfill soil costs |
| 2. Enhanced Bioremediation | Introduce biological nutrients to aid in biological breakdown and treatment of excavated soil | No – not useful for treating lamp black affected soil, and does not work with project timeline and site working area requirements | <ul style="list-style-type: none">• Inexpensive treatment• Long history of success with petroleum wastes | <ul style="list-style-type: none">• Little control of schedule and endpoint• Requires large off-site area• Produces off-gas odors• Still requires soil disposal and backfill to continue on-site operations |
| 3. On-site Thermal Desorption | Use on-site thermal desorption to treat excavated soil prior to backfill | No – requires mobile source air permit for on-site unit, and large working area for soil handling | <ul style="list-style-type: none">• Treatment of soils to Soil Remediation Levels (SRLs) or Groundwater Protection Levels (GPLs)• Proven Technology• No off-site trucking of soils• Can use treated soil for backfill | <ul style="list-style-type: none">• Difficult to permit in residential areas• Hazardous waste need to be sent to appropriate landfill for disposal• Large on Site space requirement; public acceptance |
| 4. Off-Site Thermal Desorption Fixed Location | Use off-site thermal desorption to treat excavated soil prior to backfill | No – requires mobile source air permit for either unit at a near-site location or fixed location; no near-site location has been identified at this time, fixed unit in California. The presence of lead in the soil prevents the effectiveness of thermal desorption. | <ul style="list-style-type: none">• Treatment of soils to SRLs or GPLs• Proven Technology• Can use treated soil for backfill | <ul style="list-style-type: none">• Requires trucking to and from location• More costly than landfill disposal because of costs• Hazardous waste needs to be sent to appropriate facility for treatment |

Notes:

¹ Residential SRL COC - A compound that exceeded the residential SRL. Source: https://apps.azsos.gov/public_services/Title_18/18-07.pdf

² Non-residential SRL COC - A compound that exceeded the non-residential SRL. Source: https://apps.azsos.gov/public_services/Title_18/18-07.pdf

³ Human Health Risk Assessment:

HHRA COPC - Compounds selected for quantitative risk estimate calculations based on the available sampling results obtained from the current site investigation. All detected compounds were considered to be COPCs and were further evaluated.

HHRA COC - The HHRA COPCs that were determined to contribute to the majority of the risk and hazard estimates or result in individual cancer risk estimates above 1 x 10⁻⁵ or an hazard estimate greater than 1

⁴ Benzo(a)pyrene toxicity equivalant (BAP-TEQ) was also identified as an HHRA COC. Residential SRLs for individual compounds included in the BAP-TEQ were identified as individual COCs, so BAP-TEQ is not listed in the table.

⁵ GPL development was conducted using the ADEQ GPL model spreadsheet (ADEQ, 2013).

⁶ Site COCs are compounds that are MGP-related compounds identified as an SRL or a HHRA COC.

⁷ Arsenic is not considered a COC based on results of the background arsenic concentration analysis.

⁸ Lead is a COC in the excavation areas (DU-1 and DU-3) located at the former gas holders

Table 7-2. Applicable Site Cleanup Criteria for COCs*APS Douglas Former MGP Site, Douglas, Arizona*

| Compound | Residential SRL (mg/kg) | | | Non-Residential SRL (mg/kg) |
|-------------------------|-------------------------|------------|----------------|-----------------------------|
| | Carcinogen | | Non-Carcinogen | |
| | 10E-6 Risk ¹ | 10E-5 Risk | | |
| PAH | | | | |
| Benzo(a)anthracene | 0.69 | 6.9 | --- | 21 |
| Benzo(a)pyrene | 0.069 | 0.69 | --- | 2.1 |
| Benzo(b)fluoranthene | 0.69 | 6.9 | --- | 21 |
| Benzo(k)fluoranthene | 6.9 | 69 | --- | 210 |
| Chrysene | 68 | 680 | --- | 2,000 |
| Dibenz(a,h)anthracene | 0.069 | 0.69 | --- | 2.1 |
| Indeno(1,2,3-c,d)pyrene | 0.69 | 6.9 | --- | 21 |
| Naphthalene | --- | --- | 56 | 190 |
| Metals | | | | |
| Lead | --- | --- | 400 | 800 |

Notes:

¹ If the current or currently intended future use of the contaminated site is a child care facility or school where children below the age of 18 are reasonably expected to be in frequent, repeated contact with the soil, the person conducting remediation shall remediate to a 1×10^{-6} excess lifetime cancer risk.

² Site-specific Human Health Risk Assessment values were not calculated for the Site as residential SRLs are conservative risk-based values and will be used as cleanup criteria.

³ Site-specific groundwater protection levels were not calculated for the Site as described in Section 3.

--- = Not Applicable

mg/kg = milligram(s) per kilogram

EPA = U.S. Environmental Protection Agency

SRL = Soil Remediation Level. Source: https://apps.azsos.gov/public_services/Title_18/18-07.pdf

RSL = EPA Regional Screening Level. Source: <https://www.epa.gov/risk/regional-screening-levels-rsls-generic-tables>

Table 7-3. Ambient Air Action Levels and Maximum Allowable Ambient Air Concentrations

| Pyrene | NA | NA | NA | NA | NA |

Notes:

¹ U.S. Environmental Protection Agency Residential Air Regional Screening Levels (November 2019). Assume 10% of RSL as action level.

<https://www.epa.gov/risk/regional-screening-levels-rsls-generic-tables>

² Site-Specific Maximum Allowable Concentrations based on the RSLs assuming an exposure duration of 4 and 6 months for offsite residential receptors based on 26 year exposure duration.

The 4-month Maximum Allowable Concentration assumes 1/78th exposure so the RSL is multiplied by 78. The 6-month Maximum Allowable Concentration assumes 1/52nd exposure so the RSL is multiplied by 52.

³ Site-Specific Maximum Allowable Concentrations based on the RSLs assuming an exposure duration of 1 year for offsite residential receptors based on 26 year exposure duration.

The 1-year Maximum Allowable Concentration assumes 1/26th exposure so the RSL is multiplied by 26.

⁴ A lead concentration of 150 lead ng/m³ corresponds to a dust limit of 731 ug/Soil/m³ as TSP based on the average of the six maximum lead results (maximum lead result from each boring) in DU areas 1 and 3.

ug/m³ = microgram per cubic meter

DU = decision unit

NA = not applicable, no RSL listed for constituent

ng/m³ = nanogram per cubic meter

TSP = total suspended particulates

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.

Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal RCRA generators list

RCRA-CESQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

A review of the RCRA-CESQG list, as provided by EDR, and dated 03/01/2018 has revealed that there are 2 RCRA-CESQG sites within approximately 0.25 miles of the target property.

State and tribal leaking storage tank lists

LUST: The Leaking Underground Storage Tank Incident Reports contain an inventory of reported leaking underground storage tank incidents. The data come from the Department of Environmental Quality's LUST File Listing by Zip Code.

A review of the LUST list, as provided by EDR, and dated 09/07/2018 has revealed that there are 4 LUST sites within approximately 0.5 miles of the target property.

AUL: DEUR and VEMUR sites. DEUR: Declaration of Environmental Use Restriction. A restrictive land use covenant that is required when a property owner elects to use an institutional (i.e., administrative) control or engineering (i.e., physical) control as a means to meet remediation goals. The DEUR runs with and burdens the land, and requires maintenance of any institutional or engineering controls. VEMUR: Voluntary Environmental Mitigation Use Restriction. A restrictive land use covenant that, prior to July 18, 2000, was required when a property owner elected to remediate the property to non-residential uses. Effective July 18, 2000, the DEUR replaced the VEMUR as a restrictive use covenant.

A review of the AUL list, as provided by EDR, and dated 08/07/2018 has revealed that there are 2 AUL sites within approximately 0.5 miles of the target property.

ADDITIONAL ENVIRONMENTAL RECORDS

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 03/01/2018 has revealed that there is 1 RCRA NonGen / NLR site within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

A review of the EDR MGP list, as provided by EDR, has revealed that there is 1 EDR MGP site within approximately 1 mile of the target property.

| <u>Lower Elevation</u> | <u>Address</u> | <u>Direction / Distance</u> | <u>Map ID</u> | <u>Page</u> |
|------------------------|------------------|-----------------------------|---------------|-------------|
| DOUGLAS GAS CORPORAT | PAN AMERICAN AVE | 0 - 1/8 (0.000 mi.) | 1 | 8 |

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there is 1 EDR Hist Auto site within approximately 0.125 miles of the target property.

CODING OF STRUCTURAL UNITS FOR FIREPROOF AND NON-COMBUSTIBLE BUILDINGS

FRAMING
CODE STRUCTURAL UNIT

- Reinforced Concrete Frame.
- Reinforced Concrete Joists, Columns, Beams, Trusses, Arches, Masonry Piers.
- Protected Steel Frame.
- Individually Protected Steel Joists, Columns, Beams, Trusses, Arches.
- Indirectly Protected Steel Frame.
- Indirectly Protected Steel Joists, Columns, Beams, Trusses, Arches.
- Unprotected Steel Frame.
- Unprotected Steel Joists, Columns, Beams, Trusses, Arches.
- Masonry Bearing Walls.

FLOORS
CODE STRUCTURAL UNIT

- Reinforced Concrete. Reinforced Concrete with Masonry Units. Pre-cast Concrete or Gypsum Slabs or Planks.
- Concrete on Metal Lath, Incombustible Form Boards, Paper-backed Wire Fabric, Steel Deck, and Cellular, Ribbed or Corrugated Steel Units.
- Open Steel Deck or Grating.

LAND USE CODE APPLICABLE TO CHANGES DIAGRAMMED AFTER 3/1/62

| | | | |
|----|-------------------------|---|-------------------------|
| R | RESIDENTIAL | M | MANUFACTURING |
| RT | RESIDENTIAL - TRANSIENT | P | PUBLIC OR INSTITUTIONAL |
| C | COMMERCIAL | U | UTILITY |
| W | WAREHOUSE | T | TRANSPORTATION |

NUMERICAL PREFIX INDICATES THE NUMBER OF ESTABLISHMENTS IN EACH CATEGORY

ROOF
CODE STRUCTURAL UNIT

- Reinforced Concrete. Reinforced Concrete with Masonry Units. Reinforced Gypsum Concrete. Pre-cast Concrete or Gypsum Slabs or Planks.
- Concrete or Gypsum on Metal Lath, Incombustible Form Boards, Paper-backed Wire Fabric, Steel Deck, and Cellular, Ribbed or Corrugated Steel Units.
- Incombustible Composition Boards with or without Insulation. Masonry or Metal Tiles.
- Steel Deck, Corrugated Metal or Asbestos Protected Metal with or without Insulation.

The coding for framing, floor and roof structural units as shown above is used in describing the construction of fire-resistive buildings. In addition, reports for fire-resistive buildings will show the date built and wall construction when other than brick.

F P buildings have masonry floors and roof; concrete and/or directly or indirectly protected steel framing; and clay brick, stone or poured concrete walls.

F P X buildings are F P buildings with inferior walls such as concrete block, cement brick, metal or glass panels, etc.

N C buildings have unprotected steel framing and fire-resistive but non-masonry floors and roof.

F P-1962
(CONC.)
A-1-a

A fire-resistive building built in 1962 with concrete walls and reinforced concrete frame, floors and roof.

F P X-1962
(METAL PANELS)
E-2-b
NONCOMB CEIL'S

A fire-resistive building built in 1962 with metal panel walls, indirectly protected steel frame, concrete floors and roof on metal lath, noncombustible ceilings.

N C-1962
(C.B.)
H-2-d

A noncombustible building built in 1962 with concrete block walls; unprotected steel columns and beams; concrete floors on metal lath and steel deck roof.

1. Introduction

The Arizona Public Service Company (APS) is proposing to conduct remediation activities at the former manufactured gas plant (MGP) site (the Site) in the City of Douglas, Arizona, under the Arizona Department of Environmental Quality's (ADEQ's) Voluntary Remediation Program in support of future development of the Site. As an initial step, APS completed an assessment of historical site data, which is summarized in the site history report (Jacobs, 2019a), and describes the Site and its history, including former operations and industrial activities, environmental issues, and previous site investigations.

The Site is located near the intersection of East 3rd Street and Pan American Avenue in the City of Douglas (Figure 1-1), in Cochise County, Section 13, Township 24 South, Range 27 East, Douglas, Arizona U.S. Geological Survey 7.5-Minute Topographic Quadrangle. The Site is approximately 200 yards north of the international border between the United States and Mexico.

The properties adjacent to the western Site boundary are owned by El Paso Natural Gas and a private landowner. The land adjacent to the northern, eastern, and southern Site boundaries are owned by private landowners. The area to the north of the Site is characterized by trees and a small wash. The area to the east of the Site contains a walkway from the United States-Mexico border to East 3rd Street, which is used by approximately 3,000 pedestrians per day. The area to the south of the Site is undeveloped land primarily used by the U.S. Border Patrol. The area to the west of the Site is largely undeveloped except for an El Paso natural gas metering station and a buried natural gas line.

The Site was formerly owned by Arizona Edison Company Gas Works, APS's predecessor company (EDR, 2018). The MGP was at the Site from approximately 1905 through 1947 and operated until at least the early 1930s. The Site is owned by the City of Douglas and is crossed by an El Paso Natural Gas easement. The City of Douglas uses the property to store construction debris consisting of soil, gravel, asphalt, and concrete. An operational history of the site is provided in Table 1-1.

A map showing the approximate locations of structures and other features associated with the former MGP that were identified based on Sanborn fire insurance maps and previous site investigation reports is shown on Figure 1-2. Figure 1-3 shows the property parcels in relation to former MGP operations based on historical reports.

According to the findings of the previous investigations, as summarized in this Site Investigation Work Plan, six subsurface MGP-related structures remain at the Site, and compounds related to the former MGP operations have impacted the subsurface soil. As a result, the Site requires additional investigation and remedial activities prior to future property development.

1.1 Objectives

According to the findings of the previous investigations, compounds related to former MGP operations remain above Arizona soil remediation levels. As a result, the Site requires additional investigation to further define the extent of impacts and guide remedial activities. The objectives of the site investigation described in this Work Plan are as follows:

- Complete the characterization of the vertical and lateral extents of soil impacts.
- Evaluate potential groundwater impacts.
- Determine the locations of the remaining subsurface structures.
- Collect data to develop a remedial action plan (RAP) consistent with Arizona soil remediation levels (SRLs) and groundwater protection levels (GPLs).

1.2 Organization

This Site Investigation Work Plan has been prepared in accordance with the ADEQ *Voluntary Remediation Program Work Plan Checklist*. The Work Plan includes the following sections:

- **Section 2, Site Description, Background, and Data Gaps**, includes the Site history, including a description of MGP operations; summaries of previous site investigations; description of the Site geology, hydrogeology, and hydrology; and a discussion of the remaining data gaps that have been identified at the Site.
- **Section 3, Proposed Investigation Activities**, describes the proposed soil sampling locations and analyses. This section also includes a proposed project schedule for investigation activities.
- **Section 4, Sampling and Analysis Plan**, describes the field sampling procedures and laboratory analysis and procedures for sample management, chain of custody, and record keeping.
- **Section 5, Public Notice and Public Participation**, describes the procedures APS will use to implement the community relations and ongoing public involvement program during investigative activities.
- **Section 6, References**, includes the references that were used to prepare this Work Plan.

2. Site Description, Background, and Data Gaps

This section presents the history of the Site, a site description, surrounding environmental issues, a summary of the MGP process and wastes, and a summary of previous investigations and data gaps.

2.1 Site Description

The geology and hydrogeology of the Site is described in this section (Geraghty and Miller, 1996a).

2.1.1 Geology

The Site is situated in the Douglas Basin of southeastern Arizona at an elevation of approximately 3,950 feet above mean sea level and lies within the Basin and Range Province in the Sulphur Springs valley. Soils from the ground surface to 5 feet below ground surface (bgs) are generally classified as coarse grained with gravels, gravels with fines, and clayey gravel (EDR, 2018). Based on the most recent site investigation, soils were classified from the center of the Site (SB-4) as silt and sand from ground surface to 3 feet bgs, clay with silt and sand from 3 to 7.5 feet bgs, a mix of clayey silt, silt, sand, and clay from 7.5 to 15 feet bgs, and medium coarse sand from 15 to 16.5 feet bgs (Geraghty and Miller, 1996a).

2.1.2 Hydrogeology

In 1990, groundwater levels within a 2-mile radius of the Site ranged from 46 to 284 feet bgs (Rascona, 1993). Small perched water zones occur locally in the upper alluvial deposits and likely account for the large variation of water levels. According to the Arizona Department of Water Resources, groundwater below the Site may be perched and is likely to be encountered at a depth of approximately 50 feet, with the direction of groundwater flow below the Site unknown because of limited data (Rascona, 1993).

2.1.3 Surrounding Environmental Issues

2.1.3.1 Local Smelting Operations

The Calumet & Arizona Company and Phelps-Dodge Corporation Reduction Works operated two copper smelters approximately 1 mile west of the Site from 1904 to 1931 and 1931 to 1987, respectively (ATSDR, 1995). During the smelting process, metal ores were heated, producing molten metals and releasing sulfur dioxide and particulate matter through two 600-foot stacks. ADEQ initiated comprehensive air monitoring in 1967 and found elevated levels of sulfates, arsenic, and lead particulates in outdoor air in Douglas. Prevailing winds generally blew toward the south and north-northeast. The smelter had a history of exceeding the U.S. Environmental Protection Agency (EPA) National Ambient Air Quality Standards allowable stack emission rates for particulate matter and sulfur dioxide gas, which led to closure of the smelter in 1987.

In 1985 the Arizona Department of Health Services collected 52 offsite (off the reduction works property) surface samples from a widespread area in Douglas to determine background lead concentrations in Douglas. Lead concentrations in Douglas ranged from 50 to 1,170 milligrams per kilogram (mg/kg), with an average lead concentration in Douglas of 254 mg/kg. The Agency for Toxic Substances and Disease Registry (ATSDR) also reported offsite maximum and mean background arsenic concentrations of 35.8 and 15 mg/kg, respectively, for surface samples located from 1 to 6 miles from the smelter site. Section 2.5 provides a detailed background metals discussion based on the ATSDR report (ATSDR, 1995).

2.3.1.2 EDR Search

Environmental Data Resources (EDR) completed a search of available environmental databases for the Site and the surrounding area. The executive summary for the EDR report (EDR, 2018), including a listing of databases searched, is presented in Appendix B.

The Site was identified on the EDR proprietary database for former MGP sites. EDR included 13 additional findings within 1/4 mile of the Site. The findings were included on the following environmental database lists:

- AST—Aboveground Storage Tank Listing
- AUL—Activity and Use Limitations list, also known as Declaration of Environmental Use Restriction
- AZURITE—ADEQ-maintained repository of sites remediated under ADEQ programs
- ECHO—Enforcement and Compliance History Information
- EMAP—All Places of Interest Listing
- FINDS—Facility Index System/Facility Registry System
- LUST—Leaking Underground Storage Tank Listing
- MANIFEST—Hazardous waste manifest information
- RCRA-CESQG— Resource Conservation and Recovery Act Conditionally Exempt Small Quantity Generator
- UST—Underground Storage Tank Listing
- VCP—Voluntary Cleanup Priorities Listing (i.e., voluntary remediation sites)

Seven of the findings were located within 1/8 mile of the Site, with four of the associated facilities having reported releases and/or violations. The companies and/or generators associated with the listings are presented below, along with a summary of the key findings:

Releases or Enforcement Actions

- **Border Express**, 305 Pan American Avenue – LUST, UST, EMAP, Enforcement

Border Express is a commercial fueling station approximately 0.1 mile northeast (upgradient) of the Site. The station had an 18,000-gallon single-walled fiberglass UST that was installed in 2000 and reported as a LUST in 2012. The UST was removed, the soil was remediated to Tier 1 standards, and the incident was closed in 2013.

- **Douglas Port of Entry**, 1 Pan American Avenue – VCP

Douglas Port of Entry is the Border Port of Entry for Mexico, located approximately 0.1 mile southeast (upgradient) of the Site. The facility was included on the VCP list for potential heating oil groundwater contamination from a former UST. A Groundwater No Further Action was issued by ADEQ in 2007 based on benzene, toluene, ethylbenzene, and xylenes (BTEX) and total petroleum hydrocarbon (TPH)-diesel concentrations achieving remediation levels.

- **U.S. Station Department Homeland Security Border**, 5 N. Pan American Avenue – UST

The Border Station is located approximately 0.1 mile southeast (upgradient) of the Site. It had a UST installed in 1934 and removed in 1990. No impacts to groundwater have been identified.

- **Border Mart Shell**, 100 E. 3rd Street – UST, EMAP, Enforcement, Financial Assurance

Border Mart Shell is a commercial fueling station approximately 0.1 mile northeast (upgradient) of the Site. The facility has two double-walled 12,000-gallon petroleum USTs that were installed in 1997. The facility received enforcement notices for violations in 2008 and 2013; the notices have been closed. No environmental releases have been reported.

- **Douglas Chevron**, 46 N. Pan American Avenue – UST, EMAP, Enforcement, Financial Assurance

Douglas Chevron is a commercial fueling station on the corner of U.S. Highway 191 and 5th Street, approximately 0.2 mile northeast (hydrologically upgradient) of the Site. The station has two 15,000-

gallon USTs installed in 2004 for gasoline and diesel. The facility had reported violations in 2006, 2008, 2013 and 2016. All cases were closed and none resulted in further investigation. Other Environmental Database Findings

- **White Knight Healthcare, Inc.**, 300 S. 1st Street – RCRA-CESQG, FINDS, ECHO

White Knight Healthcare is a commercial disposable healthcare equipment manufacturing company located upgradient of the Site, approximately 0.2 mile east (upgradient). It is a CESQG. No violations or releases have been reported.

- **Hamlin, Inc.**, 230 International Ave. – RCRA Nongen, FINDS, ECHO

Hamlin Inc. registered with the FINDS database in 1990 and is a RCRA non-generator. No violations or release have been reported.

- **Walmart**, 199 West 5th Street – AST, RCRA-CESQG, EMAP, MANIFEST

Walmart is located approximately 0.25 mile north of the Site (hydrologically downgradient). It is a CESQG with an AST installed in 2004. No violations or releases have been reported.

2.2 Douglas MGP Site History

The history of the Site, a description of MGP processes and waste, and the environmental issues are presented in this section and summarized in Table 1-1. Historical information about the Site was obtained from the following documents:

- *Site Investigation, Former Manufactured Gas Plant, Douglas, Arizona* (Geraghty & Miller, 1996a)
- *Composite Soil Sampling, Former Manufactured Gas Plant, Douglas, Arizona* (Geraghty and Miller, 1996b)
- *Material Removal Activities, Former APS Manufactured Gas Plant Site, Douglas, Arizona* (Arcadis/Geraghty & Miller, 1998)

Additionally, copies of the following Sanborn fire insurance maps and EDR report were reviewed:

- Sanborn Fire Insurance Maps – 1909, 1914, 1929, and 1947 (Appendix A; Geraghty & Miller, 1996a)
- Aerial Photographs – 1958, 1970, 1979, 1984, 1992, 2003, 2007, 2010, and 2017 (EDR, 2018)

2.2.1 Site Ownership and Operational History

Geraghty & Miller Inc. reviewed Sanborn Insurance Maps from 1909, 1914, 1929, and 1947 and gas production statistics from the Brown's Directory of American Gas Companies (Brown's Directory) for select years from 1906 through 1932 to develop an operational history of the Site. Historical information in this section was obtained from aerial photographs provided by EDR (EDR, 2018) and from the investigation reports listed previously, including the historical Sanborn maps. A summary of the operational history of the Site is presented in Table 1-1.

The Site began operation as a municipal MGP between 1903 and 1908 and continued until the early 1930s, primarily using oil as the feedstock. The Douglas Gas Corporation operated the MGP until 1925. Sanborn maps indicate that the MGP was operated by Arizona Edison Company, a corporate predecessor of APS, from 1925 until it ceased production around 1932. APS sold the property to a private landowner in 1966. The City of Douglas acquired the property in 1987. The 1929 Sanborn map shows the relative locations of the former MGP structures. The 1947 Sanborn map shows the Site as mostly vacant, with the former concrete storage shed, purifier, and the concrete meter house still present. Based on information from the *Brown's Directory of American Gas Companies* (Brown's Directory), 13,700,000 cubic feet (ft³) of gas was manufactured in 1910 and 51,500,000 ft³ of gas was manufactured in 1930 (Geraghty & Miller, 1996a).

The 1958 aerial photograph in the EDR report has limited resolution; however, the former gas holders and/or concrete pads, purifier structure, and possibly the concrete shed are somewhat visible. The wash to the north of the Site is visible and is located approximately 150 feet north of the purifier structure. The large concrete purifier, small concrete shed, concrete foundations for two gas holders, a generator house, and a steel manhole cover bolted to a crude oil sump were present at the Site in 1996 (Geraghty and Miller, 1996b). Two concrete gas holder pads, two concrete small purifier pads, concrete foundations of the meter house, a portion of the generator house foundation, and possibly the small concrete storage shed foundation remained on the Site in 1996 after removal actions were complete (Arcadis/Geraghty & Miller, 1998). There is conflicting information in the Arcadis/Geraghty & Miller report regarding whether the storage shed foundation was removed or not.

The City of Douglas property parcel and surrounding property parcels near the Site contain bulk construction debris piles, including soil, concrete, asphalt, and gravel. A vegetative cover can be seen over the construction debris in a 2017 aerial photograph from the EDR report.

The following list provides a summary of the Site structures shown on Figure 1-2 and operations based on previous investigation reports (Geraghty & Miller, 1996a; Arcadis/Geraghty & Miller, 1998):

- **Generator House.** The generator house was used to manufacture oil gas, with an annual production ranging from approximately 13,700,000 ft³ in 1910 to approximately 51,500,000 ft³ in 1930. A portion of the generator house foundation remains on the Site.
- **Oil Sump/Tank.** An oil sump, approximately 2.5 feet in diameter and 3.5 feet tall and associated with a suspected aboveground oil tank of unknown capacity, was located west of the large purifier. The oil sump/tank was removed in August 1996.
- **Gas Holders.**
 - One large gas holder, approximately 102,000 ft³ in capacity, was located east and southeast of the generator house. The concrete gas holder pad remains on the Site. The approximate location of the large gas holder is shown on Figure 2-2 as Gas Holder 1 for investigation identification purposes.
 - One medium gas holder, approximately 30,000 ft³ in capacity, was located east of the generator house. The concrete gas holder pad remains on the Site. The approximate location is shown on Figure 2-2 as Gas Holder 2 for investigation identification purposes.
- **Purifiers.**
 - One large purifier structure, approximately 40 feet in diameter and 15 feet high, was located northeast of the generator house. The large concrete purifier pad was removed in August 1996.
 - Two small purifiers of unknown capacity were located east of the generator house. The two small concrete purifier pads remain on the Site. The approximate locations of the small purifiers are shown on Figure 2-2 as Purifier 1 and Purifier 2 for investigation identification purposes.
- **Meter House.** A meter house of unknown size was located southeast of the generator house. The foundation of the meter house remains on the Site.
- **Debris Pile.** One debris pile, 250 feet long (north-south direction) by 130 feet wide, was located west of the generator house. The debris pile was removed in August 1996.
- **Storage Shed.** One small concrete storage shed, 10 feet long by 10 feet wide, was located north of the generator house. The concrete shed was removed in August 1996. The text of the Arcadis/Geraghty & Miller historical report indicates the concrete foundation of the shed remains on the Site; however, the figures in the report indicate the foundation does not exist (Arcadis/Geraghty & Miller, 1998).

2.2.2 Description of MGP Processes

In the United States, the first uses of manufactured gas for lighting were reported in Philadelphia in 1796 and in Richmond, Virginia, in 1803. Manufactured gas was produced by the following three primary processes:

- Coal carbonization (coal gas)
- Carbureted water gas (CWG)
- Oil gas

Based on historical records, only the oil gas process was used at the Site (Geraghty & Miller, 1996a). However, the coal gas and CWG processes are described in this section for comparison to the oil gas process.

2.2.2.1 Coal Carbonization

The earliest MGPs used coal carbonization to produce gas. Coal gas was used exclusively from 1816 to 1875, when the CWG process was developed. Coal was used as a feedstock to produce gas in various types of retorts, with coke generated as a byproduct. Based on historical records, coal gas was not used at the Site.

2.2.2.2 Carbureted Water Gas

CWG involves the enhancement of water gas (blue gas) by spraying oil into a hot vessel that contains the water gas, thereby increasing the calorific value of the water gas. Blue gas was an abundant byproduct of the petroleum industry, which made CWG the most important manufactured gas process in the United States at the time.

The CWG process is intermittent, with alternating "blows" or blast periods and "runs" or gas-making periods. The typical CWG-generating equipment consisted of three brick-lined cylindrical steel vessels: the generator, the carburetor, and the superheater. During a blow, a producer gas that is high in carbon dioxide is formed in the generator by passing air through an incandescent mass of coke or anthracite. This gas is burned by secondary air. The hot products of combustion heat the carburetor checkbrick and then pass from the top of the superheater to the stack. During a run, water gas is made in the generator and then passed into the top of the carburetor, where the oil is sprayed. This mixture is passed down through the carburetor and up through the superheater. As the mixture passes the hot checkbrick, the mixture is thermally cracked and fixed into gases. The CWG, a mixture of blue and oil gas, is passed from the top of the superheater through a water-sealed wash box, where the gas is initially cooled and some of the heavy tars are condensed and removed.

The gas is passed through additional condensers to cool the gas to ambient temperatures. Direct contact with water cools and scrubs the gas. The gas is then sent to a relief holder, which provides constant pressure for gas outflow to the purifying systems during blows and runs. Larger plants featured tar extractors, naphthalene scrubbers, and liquid purification systems to remove the bulk of the hydrogen sulfide prior to passing the gas through the dry purification systems. After hydrogen sulfide removal at these larger plants, the gas was metered and sent to the storage holders pending distribution to the customers.

2.2.2.3 Oil Gas

The oil gas process consists of thermocracking oil in a steam atmosphere. The generating equipment is similar to that used by CWG production. The generator was replaced by a vaporizer similar to the carburetor, filled with checkbrick, and equipped with an oil spray. The carburetor was replaced by a vaporizer followed by a superheater, similar to the CWG process.

The process is cyclical and consists of blows and runs. During a blow, oil is combusted in the vaporizers, and the products of combustion heat the checkbrick of the vaporizers and superheater and pass from the

top of the superheater to the stack. During a run, oil is sprayed into the vaporizer in the absence of air and in the presence of steam. As the mixture passes the hot checkbrick, it is thermally cracked and fixed into gases.

During the run, the stack valve is closed and the oil gas passes to the washbox. The remainder of the process is the same as the CWG process.

2.2.3 Description of MGP Waste

The information in this section was obtained from the historical information regarding MGP processes and previous reports.

Byproducts formed during the manufacture of oil gas were iron oxide purifier waste, light oils, tar, and lampblack. The light oils and tars were generally recovered during condensing or scrubbing operations. Each waste is described as follows:

- **Lampblack** – The formation of a large amount of lampblack was unique to the oil-gas processes. Lampblack resulted from the high temperature of the gas-making operation, and the amount of lampblack recovered depended on the manufacturing process used. In most plants, lampblack was regarded as a valuable byproduct and was the source of additional revenue or was used as fuel. Depending on the process, approximately 20 pounds of lampblack were formed for every 1,000 ft³ of gas manufactured, with the majority of the lampblack removed from the gas stream in the wash box. The water from the wash box containing this lampblack in suspension passed through large overflow pipes and was typically stored in settling ponds. Available evidence does not indicate the former presence of a lampblack settling pond. However, because the oil gas process was used at the Site, it is likely lampblack was produced. The chemical constituents of lampblack include carbon, polynuclear aromatic hydrocarbons (PAHs), and heavy metals.
- **Tar** – Tar was produced by oil-gas processes and consisted of complex hydrocarbons that were removed from the gas stream immediately after generation during cooling, were condensed during gas cooling in the relief holder, or were removed during secondary purification. Areas where tar may have accumulated include the gas holders, areas along underground piping, areas adjacent to gas generators and scrubbers, and in a lampblack settling pond. Chemical constituents of tar include volatile aromatic hydrocarbons and PAHs. The tar was primarily reused as a supplement to boiler fuels, with a small fraction sold.
- **Fuel Oil** – Fuel oil was used as the primary feedstock material for the oil-gas process. Oil was sprayed into the gas-generating apparatus and cracked into lighter hydrocarbon fractions during gas production. Various grades of fuel oil were likely used throughout the Site's history, with increased use of heavy fuel oil or residual oil during peak production years. Areas where oil may be encountered include fuel oil tanks and oil storage tanks. Oil used at the Douglas property was likely stored in an aboveground steel crude oil tank at the Site (Figure 1-2; Geraghty & Miller, 1996a).
- **Iron Oxide Purifier Waste** – Wood chips saturated with ferric hydrate were used to remove the hydrogen sulfide from the gas during the final purification process. Some tars or lampblack may also have been removed in the purifiers. Wood chips were replaced as they became depleted or "spent." Areas that may be impacted by iron oxide purifier waste include the former purifier locations and area between the purifiers. Constituents include metals, sulfur, sulfates, cyanide compounds, and PAHs.

2.3 Previous Site Investigations

Since 1995, the following site investigations and remedial activities have been conducted at the Site:

1995 – Site Investigation. Geraghty & Miller conducted a site investigation, with sampling events in October 1995 and December 1995, to evaluate the presence or absence of MGP residuals at the Site. The primary purpose of the investigation was to assess the nature and extent of potential contamination resulting from past MGP activities at the Site and to assess the presence of potential pathways of contaminant migration. The site investigation was limited to surface and shallow subsurface soil sampling

(up to 21 feet bgs). A total of 14 surface soil samples, 23 subsurface soil samples, and 2 duplicate samples were collected.

1996 – Site Investigation. Based on 1995 investigation results, Geraghty & Miller collected five composite surface-soil samples on June 1, 1996, within a 20-foot radius of the areas where MGP impacted soil was previously identified. Each composite sample consisted of six to eight discrete locations within each sampled area. In addition, a composite of the five composite samples was submitted to the laboratory for analysis. Based on visual observation and data from the site investigation, five areas of the Site were identified and recommended for soil removal.

1996 – Interim Remedial Action. Geraghty & Miller conducted material removal and sampling activities in August 1996 to address the five areas recommended for soil removal. Based on the analytical results from the initial removal action, three additional areas were identified for soil removal.

In December 1997, Chapter 7, Article 2 of the Arizona Administrative Code was amended to establish predetermined residential and non-residential SRLs to protect human health and the environment that were consistent with the methodology used by EPA and Region 9 EPA guidance for the calculation of risk-based screening levels. ADEQ revised these SRLs, effective May 5, 2007.

The previous investigations occurred before 1997, when the SRLs were promulgated, or used the 1997 SRLs for comparison during evaluations. To provide consistency, this section compares the results of previous investigations to the 2007 SRLs. Most of the compounds identified in the 2007 SRLs as carcinogens include residential SRL values for both 1×10^{-5} and 1×10^{-6} excess lifetime cancer risks. The 1×10^{-5} risk value may be used during remediation unless a future use of the site will be as a childcare facility or school. Sample results were compared to the 1×10^{-5} risk value for carcinogens because the Site is not currently used for, or anticipated to be used for, a school or daycare facility.

The following sections present an overview of the investigations and interim removal action (IRA), including soil sampling results. Figure 2-1 shows the former soil sampling locations.

2.3.1 Soil Investigations

Soil sampling was conducted during previous investigations by Geraghty & Miller and Arcadis/Geraghty & Miller in 1995 and 1996. Figure 2-1 shows the locations of soil samples collected during the previous 1995 soil investigation, and the areas where composite samples were collected prior to and after soil removal activities in 1996. The previous soil investigations evaluated the presence of MGP-related contaminants in soil, including PAHs, TPHs, metals, and BTEX. Tables 2-1, 2-2, 2-3, and 2-4 present the analytical results from former sampling activities for PAHs, TPHs and fuel hydrocarbons, BTEX, and total metals, respectively. Figures 2-2, 2-3, 2-4 and 2-5 show the locations where PAH, lead, arsenic, and TPH were detected during previous investigations, respectively, and further identifies the locations with concentrations above residential or non-residential SRLs.

2.3.1.1 October 1995 – Soil Investigation

The October 1995 site investigation included surface and subsurface soil sampling. Fourteen surface soil samples, 23 subsurface, and 2 duplicate samples were collected. Four of the surface samples (SS-8, SS 11, SS-12 and SS-13) were collected from offsite locations to evaluate local background concentrations of MGP-related compounds.

2.3.1.1.1 Surface Sampling

Fourteen surface samples were collected between the ground surface and 6 inches bgs. Samples were analyzed for PAHs, total cyanide, and total metals by Analytical Technologies Incorporated laboratory in Phoenix Arizona. Analytical results for PAHs are presented in Table 2-1, and results for metals and cyanide are presented in Table 2-4.

Eight of the surface soil samples exceeded the residential SRLs for select PAHs as follows:

- SS-1 – Benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene
- SS-5 – Benzo(a)pyrene, benzo(b)fluoranthene, benzo(b)fluoranthene, benzo(k)fluoranthene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene
- SS-6 – Benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene
- SS-7 – Benzo(a)pyrene and indeno(1,2,3-cd)pyrene
- SS-2, SS-10 and SS-14 – Benzo(a)pyrene

Five of the surface soil samples also exceeded the non-residential SRLs for select PAHs as follows:

- SS-1 – Benzo(a)pyrene, benzo(b)fluoranthene, and indeno(1,2,3-cd)pyrene
- SS-5 – Benzo(a)anthracene, benzo(b)fluoranthene, benzo(a)pyrene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene
- SS-4, SS-6, and SS-7 – Benzo(a)pyrene

The highest concentrations of all PAHs detected were in sample SS-5. Benzo(a)pyrene was detected at a concentration of 230 mg/kg. The non-residential SRL for benzo(a)pyrene is 0.69 mg/kg. SS-5 was located on the north end of the Site and was not adjacent to any known former MGP structures. Figure 2-2 shows the locations where PAHs were detected above SRLs during the October 1995 investigation.

Arsenic was detected above the residential and non-residential SRL of 10 mg/kg in 11 of the surface samples (SS-1 through SS-7, SS-9, SS-10, SS-11, and SS-13). The highest concentration of 83.5 mg/kg was detected in sample SS-6. Lead was detected in samples SS-6 and SS-7 at concentrations of 2,530 mg/kg and 2,290 mg/kg, respectively, which is above the non-residential SRL for lead of 800 mg/kg. SS-6 and SS-7 were located adjacent to the southern former gas holder and the purifier structure, respectively. Figure 3-4 shows the locations where metals were detected above the SRLs during the October 1995 investigation. Maximum and mean lead concentrations in soil of 1,170 and 254 mg/kg respectively, and maximum and mean arsenic concentrations of 35.8 and 15 mg/kg respectively have been reported by the ATSDR (ATSDR, 1995). Section 2.4.3 provides detailed information on background metals concentration at the Site and surrounding environmental issues.

2.3.1.1.2 Soil Boring Sampling

Twenty-three subsurface samples were collected from 10 soil borings at depths ranging from 1.5 feet to 21.5 feet. The borings were located near former MGP structures. An onsite Analytical Technologies Incorporated mobile laboratory analyzed the subsurface samples for BTEX and TPH. Subsurface soil samples that were visibly degraded were also analyzed for total metals, cyanide, and PAHs at the Analytical Technologies Incorporated laboratory in Phoenix, Arizona. Tables 2-1, 2-2, 2-3, and 2-4 present the analytical results for PAHs, TPHs, BTEX, and total metals, respectively. Figures 2-2 through 2-5 show the locations of SRL exceedances for PAHs, lead, arsenic, and TPHs.

Samples from borings SB-1, SB-2, SB-6, and SB-9 had detections of at least one PAH compound at depths ranging from approximately 1 foot to 10 feet. The only concentration exceeding a residential and/or non-residential SRL was observed in boring SB-4 at 1.5 feet bgs, with a benzo(a)pyrene concentration of 4.5 mg/kg, which exceeds the non-residential SRL of 2.1 mg/kg. SB-4 was located north of the small purifiers and west of the central gas holder. The remaining PAH results from all borings were below the residential SRL. Figure 2-2 shows the locations where PAHs were detected above SRLs during the October 1995 investigation.

BTEX compounds were not detected above the laboratory reporting limit of < 0.025 mg/kg in any soil boring samples. TPH was detected in three soil borings (SB-1, SB-4, and SB-8), with a maximum concentration of 4,000 mg/kg in boring SB-4 at a depth of 1.5 feet bgs. The deepest observed TPH concentration was at approximately 10 feet bgs in boring SB-8. Figure 2.5 shows the locations where TPH was detected during the October 1995 investigation.

Arsenic was detected above the residential and non-residential SRL of 10 mg/kg in all samples collected from the 10 soil boring locations, except in one sample from boring SB-8. Arsenic concentrations ranged from 8.7 to 42.1 mg/kg at depths of up to 16.5 feet, with the highest concentration of 42 mg/kg detected in boring SB-2 at approximately 10 feet bgs. The ATSDR has reported maximum and mean arsenic concentrations in the Douglas Site area of 35.8 and 15 mg/kg, respectively (ATSDR, 1995).

Soil boring logs from the previous investigations are included in Appendix C.

2.3.1.1.3 Oil Sump and Purifier Contents Sampling

Waste characterization samples were collected from the sludge in the oil sump and the contents of the large purifier.

The oily sludge sample from the oil sump was analyzed for TPH, RCRA Metals, semivolatile organic compounds (SVOCs), and sulfides, with the following results:

- Total hydrocarbon concentration of 477,000 mg/kg
- Fuel hydrocarbons measured as C6-C10, C10-C22, and C22-C36, with concentrations of 7,300, 270,000, and 200,000 mg/kg, respectively
- No detections of SVOCs (analyzed in accordance with the toxicity characteristic leaching procedure [TCLP] preparation for hazardous waste characterization)
- One volatile organic compound (VOC) was detected (xylene at 180 mg/kg)
- Lead and barium were detected at 1.7 and 0.6 milligram per liter (mg/L) (analyzed for RCRA TCLP metals). Silver, arsenic, cadmium, chromium, mercury, and selenium were not detected.

Samples were collected from the contents of the purifier from the surface to approximately 6 inches bgs on October 25, 1995 (sample SS-3) and March 20, 1996 (sample Purifier). The results from sample SS-3 were as follows:

- Arsenic result at 17.9 mg/kg, above the residential and non-residential SRL
- PAH and metals concentrations below the residential SRLs
- Reactive sulfide concentration of 30.3 mg/kg
- Total sulfur content of approximately 12 percent

The contents of the oil sump and the purifier were not characterized as RCRA hazardous waste.

2.3.1.2 June 1996 – Composite Surface Soil Sampling

Based on the October 1995 investigation results, composite surface soil sampling was conducted in the areas where the soil appeared to have been impacted by former MGP operations. The purpose of the sampling effort was to characterize material that potentially could be disposed of during remedial activities.

Samples were collected within a 20-foot radius of each of the five former surface sampling locations (SS-1, SS-4 through SS-7) that appeared to have been impacted by MGP operations based on analytical results from the previous investigation. Sampling areas are shown on Figure 2-1. Composite samples were also collected near the offsite background surface sample locations SS-11 and SS-12. A composite sample of all the samples collected (Sample COMP) was also analyzed. The composite samples were analyzed for TPH, TCLP metals, SVOCs, and total metals to evaluate whether soil would need to be managed as a RCRA hazardous waste or a petroleum-contaminated soil (PCS) special waste during remedial activities.

TPH was detected in all composite samples at concentrations ranging from 40 to 780 mg/kg (SS-6 Area). TPH was also detected in the offsite composite sample from Area SS-11/SS-12 at a concentration of 110

mg/kg. TPH concentrations are presented in Table 2-2. Concentrations of BTEX compounds were below the laboratory detection limit of 0.025 mg/kg, as presented in Table 2-3. Figure 2-4 shows the composite sampling areas where TPH was detected during the October 1995 investigation.

Arsenic concentrations exceeded the residential and non-residential SRL of 10 mg/kg in samples from Areas SS-4/SS-7 and SS-6. Lead concentrations exceeded the non-residential SRL of 800 mg/kg in the sample from area SS-6 (1,100 mg/kg) and the residential SRL of 400 mg/kg in the sample from area SS-1 (410 mg/kg). Total metals concentrations are presented in Table 2-4. Figure 2-3 shows the composite sampling areas where metals were detected above SRLs during the October 1995 investigation.

TCLP metals and TCLP SVOCs were below the RCRA toxicity characteristic limits.

2.3.2 Remedial Activities – Interim Removal Actions

Based on visual observation and data collected from the soil investigations, the following areas were identified for material removal:

- Oil sump contents
- Purifier structure contents
- Surface soil impacted with metals
- Surface soil impacted with hydrocarbons
- Debris pile impacted with hydrocarbons

Material removal activities were conducted in two phases. Phase I consisted of removing the debris pile, select surface soil, the contents of the purifier and oil sump, the concrete shed in the northwestern portion of the Site, and the purifier. Phase II consisted of removing additional surface soil. The remedial action levels used were the 1996 non-residential health-based guidance levels for PAHs and arsenic cleanup criteria of 15 mg/kg, based on the background arsenic concentration for the City of Douglas area.

Tables 2-1 through 2-4 include the analytical results for soil sampling activities conducted during the soil investigations and removal actions. Figures 2-2, 2-3, 2-4 and 2-5 show the locations where PAHs, lead, arsenic, and TPHs, respectively, were detected during previous investigations, including the IRAs, and further identifies the locations where concentrations exceeded residential or non-residential SRLs. TPH does not have an associated 2007 residential or non-residential SRL. Details of the Phase I and Phase II IRAs are provided in this section.

2.3.2.1 August 1996 – Interim Removal Action

The Phase I IRA was performed in August 1996 and consisted of removing the debris pile, oil sump, concrete shed, purifier, and surface soil previously identified as being impacted with metals and/or PAHs and performing confirmation sampling to evaluate whether additional soil removal was required. Environmental Response, Inc. (ERI) was the IRA contractor, performing demolition and removal activities; Geraghty and Miller prepared the work plan; and Arcadis/Geraghty Miller provided oversight of ERI and collected soil confirmation samples.

2.3.2.1.1 Debris Pile Removal and Sampling

The debris pile was removed in August 1996. An area measuring 130 feet in an east-west direction by 250 feet in a north-south direction was excavated until visibly clean soil was observed. Available information did not indicate the depth of excavation and referred to the samples as “surface samples.” The excavated area is shown on Figure 2-2 (Geraghty and Miller, 1996b).

The material from the debris pile was placed on a shaker apparatus to separate bricks, vegetation, and other miscellaneous debris from the lampblack material. The lampblack was transported to Waste

Management's Butterfield Station Regional Landfill as a special waste soil and the remaining debris was characterized as PCS solid waste.

Following removal of the debris pile, an area measuring 100 feet east-west by 125 feet north-south was divided into twenty 25-foot square sections, as shown on Figure 2-5. A composite sample was collected from each section and analyzed for TPH. If TPH concentrations exceeded 30 mg/kg in a grid section sample, an additional foot of soil was excavated and a second composite sample was collected. Samples were labeled based on the section from which they were collected (i.e., Debris No.) with a "B" added if the area was further excavated and sampled again.

Additionally, five additional composite samples (Debris A, B, C, D, and E) were collected by compositing the samples from four grid sections. The samples were submitted to the laboratory for the analysis of lead, arsenic, and PAHs. Figure 2-5 shows the composite sampling areas.

Laboratory TPH results of the section samples indicated the initial samples from Sections 3, 4, 9, and 19 exceeded 30 mg/kg, with a maximum concentration of 590 mg/kg in sample Debris 4. An additional 1 foot of soil was excavated in these areas and a composite sample of the remaining samples was collected. All results from the second sampling effort were below the laboratory detection limit of 20 mg/kg.

One PAH (benzo(a)pyrene) result of 0.7 mg/kg at area Debris A exceeded the residential SRL of 0.69 mg/kg. Arsenic results from area samples ranged from 14 to 19 mg/kg, exceeding the residential SRL for arsenic, with the results consistent with historical ATSDR Douglas area mean and maximum background values of 15 and 35.8 mg/kg, respectively (ATSDR, 1995). Lead results ranged from 12 to 100 mg/kg and were below the residential SRL of 400 mg/kg in all samples and below the non-residential SRL. It should be noted current background lead and arsenic levels are planned to be evaluated as part of this Site Investigation Work Plan. Historical background metals are further discussed in Section 2.4.3 and the planned background metals evaluation is described in Section 3.3.

2.3.2.1.2 Oil Sump Removal

The contents of the oil sump were removed on August 13, 1996. Approximately 30 gallons of fluid (oily sludge) were removed. The oil sump was removed on August 16, 1996. When removed, the sump was approximately 2.5 feet in diameter and 3.5 feet long, with no perforations. No visible staining of the surrounding soil was observed during sump removal. The oil sump and contents were recycled at the proper facility. Soil sampling was not performed at the oil sump location.

2.3.2.1.3 Shed and Purifier Removal and Sampling

The concrete shed and purifier were removed in August 1996 and included the following activities:

- On August 5, 1996, Spray Systems Environmental performed an asbestos inspection prior to removal of the concrete shed and purifier and submitted a National Emission Standards for Hazardous Air Pollutants notification for demolition of the structures.
- On August 19, 1996, approximately 261 tons of material were removed from the purifier structure and transported to Waste Management's Butterfield Station Regional Landfill as solid waste. The shed and purifier structure were demolished (the concrete pad remained), and approximately 230 tons of concrete from the shed and purifier structure demolition were transported to Speedway Landfill for management as a solid waste.
- On August 20, 1996 composite samples were collected from the following locations (shown on Figure 2-5) and submitted to the laboratory for TPH analysis:
 - Area adjacent to the north of the purifier (PUR-N)
 - Area adjacent to the south of the purifier (PUR-S)
 - Area adjacent to the east of the purifier (PUR-E)
 - Area adjacent to the west of the purifier (PUR-W)

TPH concentrations in the composite samples ranged from 71 mg/kg at PUR-N to 520 mg/kg at PUR-E.

- On August 21, 1996, the concrete purifier pad was removed and approximately 78 tons of concrete were transported to Waste Management's Butterfield Station Regional Landfill as solid waste.

Soil to the north and west of the concrete pad was excavated. Depth of excavation was not provided in the report but is estimated to be approximately 1 foot bgs based on other activities at the site. Soil to the south and east of the pad was not excavated because of the presence of the El Paso natural gas line.

Composite samples were collected from the following locations (shown on Figure 2-1) and analyzed for arsenic, lead, and TPH:

- Area adjacent to the north side of the purifier (PUR-N with August 21, 1996 date)
- Below the former purifier pad (Subpurifier)

TPH concentrations were 140 and 57 mg/kg from PUR-N and Subpurifier samples, respectively. Arsenic concentrations were 11 and 15 mg/kg from PUR-N and Subpurifier samples, respectively, which are above the residential and non-residential SRLs of 10 mg/kg and below and equal to the ATSDR background concentration of 15 mg/kg.

On August 22, 1996, the area north of the purifier pad and the area below the purifier pad were regraded and composite samples were collected (PUR-N-B and SUBPUR-B) and submitted for PAH analysis. Depth of excavation was not provided in the report but is estimated to be approximately 1 foot bgs. PAHs were detected below residential SRLs in PUR-N-B. Figure 2-2 shows the composite sampling locations and PAH results.

2.3.2.1.4 Surface Soil Impacted with Metals and PAHs Removal and Sampling

Surface soil sampling results from four locations (SS-4 through SS-7) sampled in October 1995 and June 1996 had detections of arsenic, lead, and PAHs. Because of the proximity of SS-4 and SS-7, these two areas were combined and are referenced as SS4/SS-7, resulting in three material removal areas (SS4-7, SS5, and SS6).

On August 19, 1996, approximately 1 foot of soil was removed from each area, resulting in a total of 894 tons of soil and other materials transported offsite to Waste Management's Butterfield Station Regional Landfill as solid waste PCS.

Samples were collected and analyzed for TPH, arsenic, lead and PAHs, as follows:

- One composite sample (SS4-7) from combined area SS4/SS7
- One composite sample (SS5 Comp) from excavated area SS-5
- Three composite samples (SS6W, SS6CENT, and SS6E) from the western, central, and eastern portions of area SS-6

TPH was not detected above the laboratory reporting limit of 20 mg/kg in SS-5 or SS-4-7 samples. Lead concentrations were below residential SRLs. Arsenic concentrations of 11 and 15 mg/kg for SS-5 and SS-4/SS-7, respectively, were above the residential and non-residential SRLs of 10 mg/kg and below and equal to the mean ATSDR background concentration of 15 mg/kg.

TPH concentrations in SS6W, SS6CENT, and SS6E ranged from 39 to 53 mg/kg; lead ranged from 11 to 217 mg/kg (below the residential lead SRL); and arsenic concentrations ranged from 18 to 24 mg/kg (above the SRL of 10 mg/kg and between the mean and maximum ATSDR background concentration of 15 and 35.8 mg/kg).

A composite sample (SS6 PAH Comp) of SS6W, SS6CENT, and SS6E was also submitted for PAH analysis. The benzo(a)pyrene result of the composite sample was 2.9 mg/kg, which is above the residential SRL.

2.3.2.2 November 1996 – Interim Remedial Action

The Phase II IRA was performed in November 1996 for removal of additional soil in the SS-6 area, the area south and east of the purifier, and along the western fence of the Site. Excavated areas were identified based on Phase I IRA results and visibly impacted soil. An Orange Coast Analytical Laboratory onsite mobile laboratory analyzed samples onsite for PAHs to determine the extent of the excavation. Samples were not collected from under the generator house or gas holder foundations. An El Paso Natural Gas representative was onsite to assist representatives of Arcadis/Geraghty Miller in locating the El Paso gas line.

2.3.2.2.1 Removal Activities

Additional removal activities were conducted on November 4 and 5, 1996, as follows:

- On November 4, 1996, approximately 1 foot of soil was removed from the SS-6 area and composite samples (SS6WC, SS6CC, and SS6EC) were collected from the western, center, and eastern areas of the excavation and analyzed for PAHs. All sample results were below the laboratory reporting limit.
- On November 5, 1996, visibly impacted material was removed from the west fence line and a composite sample (WESTFENCE) was collected for PAH analysis. All sample results were below the laboratory reporting limit.
- On November 5, 1996, 1 foot of soil was removed from the south and east of the former purifier and three composite samples were collected (PURS31, PURS32, and PURE31) and analyzed for PAHs, with the following results:
 - PURS31 results for benzo(a)pyrene (6.6 mg/kg) and benzo(a)anthracene (6.9 mg/kg) exceeded the non-residential and residential SRLs, respectively.
 - PURS32 result for benzo(a)pyrene (1.8 mg/kg) exceeded the residential SRL.

Because of the presence of MGP-impacted soil, an additional 1.5 feet of soil were excavated at these locations and two additional composite samples (PURS41 and PURS42) were collected. The benzo(a)pyrene result of 1.5 mg/kg from PURS42 exceeded the residential SRL. The remaining PAH results were less than the residential SRL.

Approximately 380 tons of material were removed during Phase II activities and transported to Waste Management's Butterfield Station Regional Landfill as solid waste PCS. Upon completion of Phase II activities, approximately 400 tons of clean fill material were used to regrade the Site.

2.3.2.2.2 Investigation-derived Waste

ERI transported the material removed from the site. All petroleum-contaminated material removed during 1996 was transported to Waste Management's Butterfield Station Regional Landfill for management as PCS. All petroleum-contaminated material removed during 1997 was transported to Waste Management's Butterfield Station Regional Landfill for management as special waste. The uncontaminated solid waste was transported to Speedway Landfill in Tucson, Arizona. The oil sump contents were transported to Allen Moore Diversified Services Incorporated in Chandler, Arizona, to be recycled. The oil sump itself was transported to EMCO Recycling in Phoenix, Arizona, to be recycled (Arcadis/Geraghty & Miller, 1998).

2.4 Preliminary Estimate of Impacts and Data Gaps

Data gaps from the previous site investigations and the 1996 IRA include soil remaining at the Site known to be impacted, uncharacterized soil, and potential impacts to deep soil and groundwater that were not characterized during the previous site investigations and remediation.

2.4.1 Impacted Soil

Based on historical data, the following five areas at the Site remain above the current benzo(a)pyrene residential SRL:

- The previous removal action reported Area-A sample concentrations of 0.7 mg/kg within the debris pile removal area after the previous remediation efforts, which is above the current benzo(a)pyrene SRL of 0.69 mg/kg.
- The results for the PUR-S 32/42 area south of the former large purifier (which was removed) and northwest of the small northwest purifier pad were 1.8 (PURS32) and 1.5 mg/kg (PURS42) at 1 foot and 2.5 feet bgs, respectively, after the previous remediation efforts.
- The result for the SS-10 surface sample collected west of Gas Holder 1 and south of the former debris pile was 1.3 mg/kg.
- The result for the SS-14 surface sample collected north of Gas Holder 2 was 0.76 mg/kg.
- The result for the SS-5 surface sample collected north of former MGP operations was 230 mg/kg, in addition to benzo(b)fluoranthene, benzo(a)anthracene, indeno(1,2,3-cd)pyrene, benzo(k)fluoranthene, and dibenzo(a,h)anthracene results of 170, 160, 160, 93, and 8.6 mg/kg, respectively. Remediation appears to have been conducted adjacent to, and south of, this location.

Based on historical data, arsenic remains above the residential and non-residential SRL of 10 mg/kg in most of the historical samples collected. The SS-1 Area sample also had a lead result of 410 mg/kg, which was above the residential SRL of 400 mg/kg and below the non-residential SRL of 800 mg/kg.

2.4.2 Uncharacterized Soil

The lateral and vertical extents of potentially impacted soil have not been fully delineated at the Site. The sample collection depths and associated analytical results from previous investigations and removal actions, along with the locations and types of former MGP structures, were evaluated to obtain a preliminary estimate of the impacts to soil. Available information indicates that impacts to soil from former MGP operations are likely limited to the upper 3 feet of soil outside the foundational structures remaining on the Site. However, the previous site investigations provided limited data on vertical impacts to soil, and contaminant concentrations in known areas at the Site (described in Section 2.4.1) remain above SRLs after the 1996 remediation efforts.

Previous remedial efforts included composite sampling and excavation at known areas of contamination, largely based on surface sample concentrations. Additionally, data from historical subsurface borings were intermittent, leaving parts of the Site uncharacterized. For example, the SB-4 soil boring was sampled at 5 and 10 feet bgs and a majority of the borings were sampled at 10 feet bgs, which neglected the shallow subsurface at 5 feet bgs; SB-9 was sampled at 10 and 15 feet bgs; and SB-8 was sampled at 10 and 20 feet bgs. The extent of potential impacts from MGP-related activities is incomplete due to these vertical data gaps.

The previous sampling strategy primarily used composite sampling of excavated areas and biased sample depths in borings without delineating the extent of soil impacts. While this strategy can be an efficient method to remove areas of known MGP-related impacts to soil, the strategy leaves data gaps in site characterization. Additional sampling is required at the Site to adequately characterize the extent of

MGP-related contamination prior to RAP development and remediation activities to remove the remaining MGP-related impacted soil.

2.4.2.1 Uncharacterized Soil Beneath Foundations

The material removal activities in 1996 did not include removal of all the subsurface foundations. The remaining foundations include the following:

- Generator house foundation
- Two concrete gas holder pads
- Concrete meter house foundation
- Two small concrete purifier pads.

Consequently, soil remains uncharacterized below the remaining foundational structures. The structures themselves also require characterization for disposal purposes. Additionally, the concrete shed foundation north of the generator house may also be present.

2.4.3 Uncharacterized Potential Impact to Groundwater

Potential impact to groundwater from MGP-related activities has not been determined based on historical data. Available historical data indicate MGP-related impacts may be limited to the upper 3 feet of soil. However, soil at the Site has not been characterized and potential impacts to groundwater have not been evaluated.

2.5 Background Metals and Surrounding Environmental Issues

The ATSDR reported background lead concentrations in the Douglas area above SRLs, with lead results from surface sampling of a widespread area in Douglas ranging from 50 to 1,170 mg/kg from samples collected from less than 3 inches bgs. Deeper lead results from two samples collected between 3 inches and 1 foot bgs were reported with lead concentrations less than 250 mg/kg (ATSDR, 1995), indicating background lead soil concentrations generally decrease with depth. Lead results from offsite residential soil are provided in Table 2-5.

The ATSDR has reported arsenic concentrations near the Site. Surface soil samples collected between 1 and 6 miles from the smelter had maximum and mean arsenic concentrations of 35.8 and 15 mg/kg, respectively, reported by the EPA and representative of background arsenic concentrations in the Douglas area (ATSDR, 1995). Additionally, samples collected from the Phelps Dodge smelter property and analyzed for arsenic had a maximum concentration of 1,840 mg/kg and a mean concentration of 422 mg/kg prior to smelter soil removal and 118 mg/kg maximum concentration after smelter soil removal. Arsenic concentrations in soil at the MGP Site after the Site Phase II IRA (Arcadis/Geraghty & Miller, 1998) ranged from 8.7 to 42.1 mg/kg, with a mean concentration of 17.1 mg/kg, which are similar concentrations to the background arsenic concentrations in the Douglas area that were reported by the ATSDR (ATSDR, 1995).

The ATSDR also reported on background groundwater concentrations (ATSDR, 1995) in the Douglas area. Groundwater samples were collected and tested by ADEQ in 1984 from Douglas municipal city well No. 6 (referenced as offsite in Table 2-6) and from a Phelps Dodge well (referenced as onsite in Table 2-6).

3. Proposed Investigation Activities

The following section describes the investigation activities proposed for the Site to provide additional information on the vertical and lateral extents of contamination from MGP-related activities and to collect information to develop a RAP. Site investigation activities will include evaluating the vertical and lateral extents of potential impacts under the remaining foundational structures, evaluating the vertical and lateral extents of impacts remaining at locations with contamination above the SRLs, and evaluating potential deeper soil impacts up to 70 feet bgs. Additionally, groundwater will be evaluated in the deeper soil borings if encountered.

The types of sampling that will be performed, proposed sampling locations, and proposed analyses are presented in this section.

3.1 Sampling

Based on available historical information, five areas have contamination levels that remain above the Arizona SRLs for PAHs in soil (the proposed soil boring identifiers are in parentheses):

- Debris A-2 area (D-SB18, D-SB19, D-SB20, and D-SB25)
- SS-10 location (D-SB22)
- SS-5 location (D-SB21)
- SS-14 location (D-SB23)
- PURS32/42 area (D-SB17)

Soil under the former MGP foundational structures and concrete pads has not been characterized. Therefore, borings are proposed to be advanced at the remaining subsurface structures and locations where historical data indicate concentrations above Arizona SRLs to evaluate MGP-related compounds of TPH, PAH, and metals. An attempt will be made to locate the former shed foundation, which may or may not remain on the Site. Borings are also proposed at and near the following foundational structures and pads:

- Gas holder pads 1 and 2 (D-SB11 and D-SB12)
- Purifier pads 1 and 2 (D-SB24)
- Meter house (D-SB13)
- Generator house (D-SB14 and D-SB15)
- Oil Sump (D-SB16)

A detailed description of the proposed soil borings is presented in Section 3.1.1.

Therefore, to evaluate data gaps, background metals, and potential groundwater impacts, 25 soil borings are proposed to be advanced at the Site, including 3 deep borings to evaluate potential deep impacts to soil and groundwater, if encountered. Samples from all borings will be analyzed for metals and PAHs. Figure 3-1 shows the proposed boring locations and concentrations where PAH compounds have been previously detected above SRLs based on historical reporting. Table 3-1 lists the sample collection depth and analyses for each boring.

As discussed in Section 2.5, the ATSDR conducted a background lead and arsenic analysis in 1995 for the Douglas area, which included the former MGP site parcels (ATSDR, 1995). However, samples will be collected to determine the current background lead and arsenic concentrations (described in Section 3.3). Twelve offsite sample locations are planned to be used in the statistical analysis (D-SB22 and D-SB25 through D-SB35). Anticipated boring locations are shown on Figure 3-1.

Geotechnical parameters will also be collected at borings D-SB11 through D-SB15, D-SB19, D-SB21, D-SB22, and D-SB24 through D-SB35 to classify soil and develop engineering parameters in areas of potential excavation.

3.1.1 Soil Borings

Where applicable, prior to advancing soil borings, surface samples will be collected at 0.5 foot bgs. Surface soil samples will be collected at boring locations not located at a foundation or pad location.

Twenty-two shallow borings and three deep borings will be advanced at the Site. The shallow soil boring depths will range from 10 to 20 feet bgs in total depth to assess the lateral and vertical extents of impact. Three deep borings will be advanced up to 70 feet bgs to assess potential deep soil impacts and the presence of perched groundwater. If groundwater is encountered in a deep boring, a groundwater monitoring well will be installed and developed, and groundwater samples will be collected to assess potential impacts to groundwater from MGP-related activities.

Based on historical boring log information, the hand-auger drilling method will be attempted to advance shallow soil borings up to 10 feet bgs, and the auger drilling method is proposed for the shallow borings greater than 10 feet bgs. If the hand-auger method encounters refusal at a shallow boring, the auger drilling method may be used to complete the soil boring or a new location will be proposed depending on laboratory results prior to refusal. The sonic drilling method is proposed for borings D-SB25, D-SB26, and D-SB26, which may encounter groundwater. Borings that exhibit MGP-related impacts based on field visual observation and screening results will be advanced farther.

Because "SB-10" was the last location identification (ID) from the historical Site investigation, the first boring location ID will start with "SB11" with a prefix of "D-" for APS Site Douglas. Proposed boring locations are shown on Figure 3-1. The following list identifies the proposed soil borings and the purpose of each boring:

- **D-SB11** – Boring D-SB11 is located at the central portion of the Gas Holder 1 pad and is proposed to be advanced through the concrete to a depth of up to 20 feet bgs. The purpose of this boring is to evaluate the vertical extent of potential MGP-related contamination under the Gas Holder #1 pad.
- **D-SB12** – Boring D-SB12 is located at the central portion of the Gas Holder 2 pad and is proposed to be advanced through the concrete to a depth of up to 20 feet bgs. The purpose of this boring is to evaluate the vertical extent of potential MGP-related contamination under the Gas Holder 2 pad.
- **D-SB13** – Boring D-SB13 is located at the central portion of the Meter House pad and is proposed to be advanced through the concrete to a depth of up to 20 feet bgs. The purpose of this boring is to evaluate the vertical extent of potential MGP-related contamination under the Meter House pad.
- **D-SB14** – Boring D-SB14 is located at the southeast portion of the Generator House foundation and is proposed to be advanced through the foundation to a depth of up to 20 feet bgs. The purpose of this boring is to evaluate the vertical extent of potential MGP-related contamination under the east side of the Generator House foundation.
- **D-SB15** – Boring D-SB15 is located at the north portion of the Generator House foundation and is proposed to be advanced through the foundation to a depth of up to 10 feet bgs. The purpose of this boring is to evaluate the vertical extent of potential MGP-related contamination under the north side of the Generator House foundation.
- **D-SB16** – Boring D-SB16 is located at the former oil tank and sump location and is proposed to be advanced to a depth of up to 20 feet bgs. The purpose of this boring is to evaluate the vertical extent of potential MGP-related contamination at the former oil tank and sump location.
- **D-SB17** – Boring D-SB17 is located to the south of the PURS32/PURS42 excavation and to the east of Purifier Pad #2 location and is proposed to be advanced to a depth of 20 feet bgs. The purpose of

this boring is to evaluate the vertical and lateral extents of remaining MGP-related contamination at the PURS32/PURS42 location.

- **D-SB18** – Boring D-SB18 is located near the southwest corner of the former Debris Pile Area A location (sample ID Debris A-2) and is proposed to be advanced to a depth of 10 feet bgs. The purpose of this boring is to evaluate the vertical extent of potential MGP-related contamination at the Debris Pile Area A location.
- **D-SB19** – Boring D-SB-19 is near the southeast corner of the Debris Pile Area A location and is proposed to be advanced to 20 feet bgs. The purpose of this boring is to evaluate the vertical extent of remaining MGP-related contamination at the Debris Pile Area A and Area B locations.
- **D-SB20** – Boring D-SB20 is located near the northeast corner of the Debris Pile Area A location and is proposed to be advanced to a depth of 10 feet bgs. The purpose of this boring is to evaluate the vertical and lateral extents of potential MGP-related contamination near the Debris Pile Area A location.
- **D-SB21** – Boring D-SB21 is located near surface sample SS-5 and is proposed to be drilled to a depth of 20 feet bgs. The purpose of this boring is to evaluate the vertical and lateral extents of remaining MGP-related contamination near the SS-5 sample location.
- **D-SB22** – Boring D-SB22 is located near surface sample SS-10 and is proposed to be drilled to a depth of 20 feet bgs. The purpose of this boring is to evaluate the vertical and lateral extents of remaining MGP-related contamination near the SS-10 sample location, as well as offsite background lead and arsenic concentrations.
- **D-SB23** – Boring D-SB23 is located near surface sample SS-14 and is proposed to be drilled to a depth of 10 feet bgs. The purpose of this boring is to evaluate the vertical and lateral extents of remaining MGP-related contamination near the SS-14 sample location and Gas Holder 2.
- **D-SB24** - Boring D-SB24 is located to the southeast of Purifier #1 pad and is proposed to be drilled to a depth of 20 feet bgs. The purpose of this boring is to evaluate the vertical and lateral extents of potential MGP-related contamination near the purifier pads.
- **D-SB25** – Boring D-SB25 is located at the northwest corner of the Debris Pile Area A location and is proposed to be advanced to a depth of 70 feet bgs. The purpose of this boring is to evaluate the vertical and lateral extents of remaining MGP-related contamination near the Debris Pile Area A location, evaluate potential impacts to groundwater at the northwest corner of the Site, and provide metals data for calculating the background metals concentration.
- **D-SB26** – Boring D-SB26 is located at the southeast corner of gas holder pad 1 and is proposed to be advanced to 70 feet bgs. The purpose of this boring is to evaluate the vertical and lateral extents of potential MGP-related contamination near gas holder 1, evaluate potential impacts to groundwater at the southeast corner of the Site, and provide metals data for calculating the background metals concentration.
- **D-SB27** – Boring D-SB27 is located southwest of the Site and is proposed to be advanced to 70 feet bgs. The purpose of this boring is to evaluate the vertical and lateral extents of potential MGP-related contamination southwest of the Site, evaluate potential impacts to groundwater southwest of the Site, and provide metals data for calculating the background metals concentration. This boring will also be used to assess horizontal and vertical PAHs if PAHs above SRLs are detected at boring D-SB22.
- **D-SB28 and D-SB29** – Borings D-SB28 and D-SB29 are located south and west of the Site and are proposed to be advanced to 20 feet bgs to provide metals data for calculating background metals concentration. These borings will also be used to assess horizontal and vertical PAHs if PAHs above SRLs are detected at boring D-SB22.
- **D-SB30** – Boring D-SB30 is located northeast of the Site and is proposed to be advanced to 20 feet bgs to provide metals data for calculating background metals concentration. This boring will also be used to assess horizontal and vertical PAHs if PAHs are detected above SRLs at borings D-SB23 or D-SB21.

- **D-SB31 through D-SB34** – Borings D-SB31 through D-SB34 are located north of the Site and are proposed to be advanced to 20 feet bgs to provide metals data for calculating background metals concentration.
- **D-SB35** – Boring D-SB35 is located northwest of the Site and is proposed to be advanced to 20 feet bgs. The purpose of this boring is to provide metals data for calculating background metals concentration. This boring will also be used to assess horizontal and vertical PAHs if PAHs are detected above SRLs at boring D-SB25.

At locations where a subsurface foundation or pad exists, the first soil sample will be collected immediately under the structure at approximately 1 foot bgs. Samples are planned to be collected in 2.5-foot intervals up to 10 feet bgs, 5-foot intervals from 10 to 30 feet bgs, and 10-foot intervals from 30 to 70 feet bgs. If the shed foundation exists, a boring will be advanced (ID D-SB36) up to 20 feet bgs and located based on visual observation of stained soil if it exists. A boring will be advanced deeper than the proposed total depth if visual and screening observations of the soil, described in Section 4.1.1, indicate MGP impacts may exist. Borings will be advanced and soil samples collected until the absence of potential MGP impacts based on visual and screening observations of the soil. A boring location may be modified based on obstructions encountered, utility locations, or observation of MGP-impacted soil during field activities. Additional borings may be drilled and sampled based on visual observations and/or analytical results to provide additional data for remediation. Table 3-1 provides a description of each sample location and lists the geotechnical and analytical testing for each sampled depth.

Generally, samples collected at the deepest depth at each boring will be held by the laboratory pending analysis based on the previous sample result. If the results of the previous sample are less than the laboratory reporting limit, the sample will not be analyzed. If refusal is encountered at a boring location, the boring location may be moved and a second attempt made within 5 feet of the originally planned location. Samples used for background metals analysis will not be collected within the Site extent shown on Figure 1-2.

Borings D-SB13, D-SB17 and D-SB23 are located near the existing El Paso Natural Gas Company gas line. Final locations for these borings will be identified during field activities to avoid potential impacts to the gas line. The borings will be located a minimum of 10 feet from the gas line location. A non-destructive method, such as air lancing or hand auger, will be used for at least the upper 10 feet at these boring locations to reduce potential impacts to the gas line. Because of safety concerns, the El Paso gas line will not be exposed during any investigation or remediation activities.

3.1.2 Chemical Analysis

The proposed analyses for each sample collected from the soil borings are listed in Table 3-1 and have been selected based on former operational activities at the Site and the results of the previous investigations. The analyses have been selected to characterize the waste streams that will be generated during the site investigations and ongoing remedial activities.

The objective of chemical analysis is as follows:

- Evaluate the presence of remaining MGP-related contamination which have not previously been characterized below PAH SRLs.
- Evaluate the vertical and lateral extent of potential MGP-related contamination in soil near the remaining subsurface foundations and concrete pads to provide data for remedial actions at the Site.
- Assist with waste characterization from remedial activities.

3.1.2.1 Extent Determination

The analyses selected to evaluate the extent of contamination were based on the results from previous investigations and historical activities at the Site. The anticipated analyses for evaluating the extent of contamination and identifying the remedial actions and the rationale for the distribution of selected analyses include:

- PAHs (EPA Method 8310 or 8270 SIM) – PAHs were identified during previous investigations at the former Debris Pile Area A, northwest of the small purifier pads at PURS42, and in surface samples SS-5, SS-10 and SS-14, with detections of benzo(a)pyrene SRL exceedances. PAH concentrations have not been assessed under the remaining foundations and pads planned for removal and are unknown. All samples are proposed to be analyzed for PAHs every 2.5 feet as described previously.
- Metals (EPA Method 6010B/7471A) – Lead was identified above the residential SRL in the SS-1 composite sample, above the non-residential SRL in the SS-6 surface discrete and composite samples, and the SS-7 surface discrete sample during previous investigations. Lead was less than the residential SRL, as described in Section 2.3.2.1.4, after IRA soil removal at the SS-6 and SS-7 (SS-4-7 composite sample) locations. The SS-1 surface composite sample result was 410 mg/kg, above the residential SRL of 400 mg/kg and below the non-residential SRL of 800 mg/kg. Arsenic was identified across the Site above the residential and non-residential SRLs of 10 mg/kg and estimated to be within background concentrations based on the 1995 ATSDR study of the Douglas area. However, due to the uncertainty of background concentrations near the Site, offsite samples will be collected and analyzed to calculate the background concentration (described in Section 3.3). Metals concentrations have not been characterized under the remaining foundations and pads. Metals are proposed to be analyzed at all boring locations.
- VOCs (EPA 8260B) – BTEX was not detected above the laboratory reporting limits based on historical soil boring results. The oil sump waste characterization results indicated the waste fluid in the oil sump had elevated TPH and xylene concentrations. The historical investigation (Geraghty and Miller, 1996) reported no evidence of leaking; however, the soil at the oil sump location was not characterized. VOCs will be analyzed from the planned D-SB16 sample location at the former oil sump to determine if there are potential vertical VOC impacts from the former oil sump. VOCs have not been detected in historical soil sampling.
- Waste Characterization – Waste characterization samples will be collected during the site investigation. Samples will be analyzed at locations where the highest concentrations are expected, generally at and under the remaining subsurface structures and at areas where data gaps exist. Collecting waste characterization samples provides several advantages, including pre-profiling soil to allow direct haul-off during remedial activities. This saves cost by reducing double-handling, eliminating the need to construct temporary stockpiles, and reducing the chance of runoff or odor issues. Composite waste samples will be collected from the concrete pads and the generator house foundation material. The following waste characterization analyses are proposed:
 - PAHs (EPA Method 8310 or 8270 SIM)
 - Total RCRA 8 metals (EPA Method 6010B/7471A)
 - Total VOCs (EPA Method 8260B)
 - PCBs (EPA Method 8082)
 - Paint filter (EPA Method 9095 [for liquid/saturated samples])
 - Ignitability
 - pH (EPA Method 9045B [for liquid samples])
 - Total cyanide (EPA Method 9014)

3.1.3 Geotechnical Analysis

Geotechnical data are needed for the site-specific GPL model and to evaluate excavation sloping and support and excavations near Site structures. The GPL model is used to determine site-specific GPLs and offsite remediation goals. The following geotechnical data are required to support the remediation design and the GPL modeling:

- Moisture content
- Sieve analysis with percent passing the No. 200
- Atterberg limit

- Porosity
- Fractional organic carbon
- In situ density
- Consolidated, undrained shear strength with pore pressure

Samples for geotechnical analysis will be collected at locations throughout the Site and at multiple depths to obtain a thorough understanding of subsurface conditions. Sample collection is concentrated in areas expected to receive additional remedial activities based on historical activities.

3.2 Groundwater Evaluation

The three deep soil borings D-SB25 through D-SB27 may encounter perched groundwater. If encountered, a notice of intent will be submitted to the Arizona Department of Water Resources using form 55-43B, a groundwater monitoring well will be installed, developed, and groundwater samples will be collected. Groundwater samples will be analyzed for the following constituents:

- PAHs (EPA Method 8310)
- BTEX (EPA Method 8021B)
- Metals (EPA Method 200.7)
- Total VOCs (EPA Method 8260B)

3.3 Background Metals Evaluation

Offsite samples will be collected for lead and arsenic analysis to evaluate background lead and arsenic concentrations near the Site. The calculated background concentrations will be used for development of a RAP. Nine offsite soil borings will be used to collect samples at 5-foot intervals to a total depth of 20 feet bgs. Sample locations were selected outside the Site extent and in undisturbed areas where feasible. Undisturbed areas were selected to avoid anthropogenic bias in the sample results. For example, samples will not be collected adjacent to Pan American Avenue because of the potential for elevated lead levels resulting from the high traffic volume of vehicles and varying fuel sources at the border. Available sample locations are also limited to property access and will primarily be collected from City of Douglas parcels. Sample intervals were determined based on previous arsenic results, available lithological data, and blow counts from historical borings.

- The highest arsenic and lead results were from surface samples: the surface horizon.
- Soils are classified as coarse grained up to 5 feet bgs: the 5-foot bgs horizon.
- Arsenic tends to increase near 10 feet bgs and a mix of clayey silt, silt, sand, and clay from 7.5 to 15 feet bgs is present: the 10-foot bgs horizon.
- Blow counts generally increase near 15 to 16.5 feet bgs, indicating a potential lithologic horizon: the 15-foot bgs horizon.
- Arsenic decreased in the boring that was advanced to approximately 20 feet bgs (SB-8): the 20-foot bgs horizon.

Three offsite borings will be advanced to 70 feet bgs off the southeast, southwest, and northwest corners of the Site extent to evaluate deeper offsite arsenic and lead concentrations and potential groundwater impacts. If groundwater is encountered, water samples will be collected to evaluate lead and arsenic in groundwater.

3.3.1 Statistical Analysis of Offsite Samples

Background threshold values will be developed with a 95/95 upper tolerance limit (UTL95-95) being the target statistic. The UTL95-95 is a 95 percent upper confidence limit on the 95th percentile of the

assumed background parent population. Upper tolerance limits will be calculated using either a distributional assumption (when deemed appropriate for the background constituent data) or using a nonparametric approach (no distributional assumption) when evidence for a distribution is not available.

Goodness-of-fit tests will be performed to determine the probability that a particular background data set could have come from the tested distribution. Because a data set can pass a goodness-of-fit test for more than one distribution, the following hierarchy will be used to choose a parametric distribution with which to calculate the background statistics:

- Normal distribution assumed – the data pass the test for normality.
- Gamma distribution assumed – the data fail the test for normality but pass the test for the gamma distribution.
- Lognormal distribution assumed – the data are not normal or gamma but pass the test for lognormality.
- Nonparametric methods used – the data fail the test for all three distributions.

The EPA (EPA, 2015) warns that use of a parametric lognormal distribution on a lognormally distributed data set may yield impractically large background values, especially when the standard deviation of the log-transformed data becomes greater than 1.0 for small data sets (less than 30 to 50 measurements). Because environmental data sets typically can be modeled by a gamma distribution, gamma distribution limits will be given preference over lognormal distribution limits, where appropriate.

3.4 Utility and Subsurface Structure Evaluation

The objective of the utility evaluation is to identify underground utilities and remnants of former MGP-related subsurface structures onsite. Prior to the start of the intrusive investigation, known subsurface utilities will be identified by Arizona 811 (formerly Arizona Blue Stake). A third-party utility locating firm will further designate the utility locations using signal line generators and ferrous magnetic locator methods. This firm will also attempt to locate abandoned utilities and subsurface structures. Additionally, El Paso Natural Gas will be contacted to ensure the El Paso pipeline has been marked properly. The areas for the soil borings will be cleared by using nondestructive air lance methods before drilling to verify no utilities are present at the boring location. The utility locations will be surveyed and added to the Site plans.

The current project schedule for the field investigation is presented on Figure 3-2.

4. Sampling and Analysis Plan

This section describes the soil sampling procedures. Also included are procedures for equipment decontamination and investigation-derived-waste disposal.

4.1 Field Sampling Procedures

4.1.1 Soil Boring Drilling

Soil borings are proposed to be advanced using hollow-stem auger, air rotary, or sonic drilling methods. A hand auger with air lancing, if needed, may be used to advance borings D-SB13, D-SB17 and D-SB23 based on field observations and if impacts to the El Paso natural gas line are anticipated. The concrete pad at soil boring D-SB13 will be cored prior to using an auger, if required. Samples will be collected at approximately 2.5-foot intervals by driving standard penetration test split-spoon samplers or ring samplers (auger or sonic drilling method) or hand driving a sampling shoe with a sleeve liner (hand auger method). If geotechnical samples cannot be manually collected, samples will be collected using the auger drill rig. The samplers will be driven in general accordance with American Society for Testing and Materials (ASTM) Method D1586.

The depth to groundwater is unknown. If any of the boreholes encounter groundwater, a notice of intent to drill a monitoring well will be filed with the Arizona Department of Water Resources (ADWR).

Lithologic observations will be recorded on a Jacobs standard boring log form or using P-log software on hand-held data acquisition devices. The field engineer/scientist will note soil attributes such as color, particle size, consistency, moisture content, structure, plasticity, odor (if obvious) and organic content. Soil cuttings will be described using the Uniform Soil Classification System and ASTM Standard Procedure D2488. Based on visual observations in the field, headspace evaluations using a photoionization detector (PID) may be conducted to identify additional sample locations.

At the completion of the borehole advancement and sample collection, the borehole will be abandoned in accordance with the ADWR Well Abandonment Handbook (ADWR, 2008). All boreholes will be filled with cement-bentonite grout using a tremie to place the grout from the bottom of the borehole.

4.1.1.1 Soil Boring Sample Collection

The standard penetration test split-spoon or ring samplers will be used to collect soil samples at depths of 2.5 feet and greater. Samples may also be collected using a hand auger and a manually driven ring sampler will be used as described in Section 4.1.1. The following procedure will be used when soil samples are collected from borings during drilling activities:

1. At some locations, geotechnical samples will be collected to assist with remedial design. When geotechnical and environmental soil samples are collected from borings at the same depth, they will be collected simultaneously while using the auger drilling method. The geotechnical samples will be collected in rings or brass sleeves that will be placed in the bottom of the sampler. Environmental samples will be collected in containers noted in Table 4-1 and will be taken from the top of the sampler.
2. A decontaminated sampler will be opened, and decontaminated sample collection sleeves or rings will be inserted.
3. The sampler will be closed.
4. The sample will be collected from the soil boring in general accordance with ASTM Method D1586.
5. The sample collection will be verified by looking into the sampler drive shoe. If no sample is retrieved, a second attempt will be made to retrieve the sample. If a second sample cannot be obtained, the boring will be advanced to the next sampling depth and sampling retried.

6. If a sample is collected, the drive shoe will be removed, and the sample collection sleeves or rings will be removed.
7. If required, methanol extractions will be performed. The fixed-base laboratory will supply 40-milliliter vials that contain a measured volume of methanol and a pre-calibrated syringe for sample collection. At the designated sample location, an intermediate sample container (a 2 to 4-ounce soil jar) will be used to place the soil sample material, followed immediately (within 30 minutes) by the transfer of approximately 5 grams of the sampled material using the pre-calibrated syringe to the 40- milliliter vial (the final sample container) and sealed using the provided vial lid.
8. For other analyses, disposable scoops will be used to transfer soil from the sleeves to glass jars.
9. Each sample will be labeled, logged into a chain-of-custody form, and placed in a sample box or cooler maintained at 4 degrees Celsius (°C) to be submitted to a laboratory for analysis.

As a result of the short hold time of EnCore™ samplers, methanol extraction is the preferred method for collecting and preserving samples for VOC analysis.

Samples will be shipped from the Clarkendale International FedEx ship center located at 1433 N G Ave, Douglas, Arizona 85607, prior to 2:45 pm.

4.1.2 Groundwater Sample Collection

The three deep soil borings will be advanced to 70 feet bgs. If groundwater is encountered, a groundwater monitoring well will be installed and developed prior to the collection of groundwater samples. Three purge volumes will be removed from the well and containerized prior to sample collection. Groundwater samples will be analyzed for the following constituents:

- PAHs (EPA Method 8310)
- BTEX (EPA Method 8221B)
- Metals (EPA Method 200.7)
- Total VOCs (EPA Method 8260B)

4.1.3 Decontamination Procedures

Equipment decontamination procedures will be used as part of the site investigation activities. Non-dedicated or non-disposable field equipment used during sampling will be decontaminated prior to, and again after, the sampling event has been completed to prevent cross-contamination between sampling locations. Decontamination procedures for field personnel are described in this subsection and in the site Health and Safety Plan (CH2M HILL, 2018).

Contamination at the Site is principally associated with PAHs and lead; therefore, pressurized hot water cleaning to remove soil and contaminants will be the primary feature of the non-disposable equipment decontamination process. Two levels of non-disposable equipment decontamination will be implemented. The first level (Level 1) will be a general decontamination process that applies to onsite non-disposable equipment used during soil drilling and excavation. The second level (Level 2) of equipment decontamination will be a specific decontamination process applied to non-disposable sampling equipment, tools, utensils, and other equipment that might contact soil samples. This decontamination protocol is based on information presented by EPA in *Protocol for Groundwater Evaluation*, OSWER DIR 9080.0-1.

4.1.3.1 Level 1 – General Equipment Decontamination

Non-dedicated or non-disposable equipment, including support and ancillary equipment, vehicles, and tools, will go through the following general decontamination process before site entry:

- Removal of all loose dirt.

- Thorough cleaning with high pressure hot water and Alconox or equivalent laboratory-grade detergent and, if necessary, scrub until all visible dirt, grime, grease, oil, loose paint, and rust flakes have been removed.
- Rinse with potable water.

Non-disposable sampling equipment will be put in a plastic-lined “dirty equipment” area for decontamination after each sampling event.

Use of disposable sampling equipment such as Teflon® tubing and plastic scoops is preferred where appropriate. Disposable sampling equipment will be disposed of properly after the equipment has been used to collect a sample or has contacted the soil.

4.1.3.2 Level 2 – Sampling Equipment Decontamination

Non-disposable sampling equipment, such as split spoons and other items that may contact the soil samples, will go through the following decontamination procedure:

- Removal of all loose dirt.
- Scrub with Alconox or equivalent laboratory-grade detergent and water.
- Rinse with potable water.
- Rinse with distilled deionized water.
- Air dry on a clean surface or rack, such as Teflon®, stainless steel, or oil-free aluminum, elevated at least 2 feet above ground.

4.1.4 Investigation-derived Waste

The following five waste streams are anticipated:

- Excavated and/or drilled soil that does not show impacts by visual or PID screening.
- Concrete from coring the gas holders and meter house pad.
- Debris from coring the generator house foundation.
- Soil that shows impact from visual or PID screening.
- Decontamination wash water.

Waste soil from soil borings will be placed in lined roll-off bins equipped with locking lids and will remain onsite pending analytical results of a waste characterization soil sample from the roll-off bin. A single composite sample will be collected from each roll-off bin. Based on the analytical results from previous sampling events, the roll-off bins will have “Special Waste” labels that identify the contents and date of generation. After results are received, the waste materials will be appropriately disposed of at a licensed facility that is approved for disposal by APS. The soil and concrete waste streams will be segregated for disposal purposes.

If laboratory results for soil and groundwater samples indicate concentrations below the SRLs of the analyzed compounds, the investigation-derived waste (IDW) water will be added to the soil prior to characterization. If laboratory results for IDW decontamination water indicate concentrations above the SRLs, the water will be allowed to evaporate onsite in a plastic lined area with a berm. If laboratory results for IDW groundwater indicate concentrations above the SRLs, the water will be disposed of properly offsite.

Used and disposable personal protective equipment and used disposable equipment will be double-bagged and placed in a municipal refuse dumpster. These wastes are not considered hazardous and can be sent to a municipal landfill.

4.2 Laboratory Analysis

The Quality Assurance Project Plan (QAPP; Jacobs, 2019b) for APS's MGP sites was revised in January 2019. The document was reviewed and approved by ADEQ in a letter dated March 2019. The QAPP was developed as specified in *EPA Requirements for Quality Assurance Project Plans for Environmental Data Operations* (EPA, 2001). The QAPP provides a description of the analytical methods to be used, the applicable laboratory Practical Quantitation Limits for each analytical method, and sample handling and storing procedures. Analytical data collected during the investigation will be maintained by the project chemist in an Access-based database.

4.2.1 Field Samples

Soil samples and waste characterization samples will be analyzed for chemical constituents depending on the sample purpose and matrix. Table 4-1 provides details for method, container type, preservatives, and holding times for each analysis.

4.2.2 Field Quality Control Samples

The purpose of the field quality assurance/quality control (QA/QC) program is to provide a measure of data quality. Field duplicates indicate the precision of the overall sampling and analysis event. Equipment and field blanks monitor contaminants that might be introduced by the sampling equipment.

The following QA samples will be collected as part of the soil sampling effort:

- **Field Duplicates.** Field duplicates will be collected at a frequency of 1 per 10 confirmation soil samples designated for offsite analysis. Field duplicates will be identified in the field and blind-coded on the sample chain-of-custody. The duplicate will be analyzed for the same parameters as the original sample.
- **Equipment Blanks.** If non-dedicated sampling equipment (e.g., hand towel, portable pump) is used, equipment blanks will be collected at a frequency of at least one per sampling event. After decontamination procedures have been performed on the sampling equipment, deionized water will be poured over the sampling equipment, collected in the proper sampling bottles, and submitted for analysis. The equipment blank will be analyzed for the same chemical parameters as the samples being collected (PAHs, metals, etc.).
- **Trip Blanks.** Trip blanks provided by the laboratory will accompany each shipment of soil samples collected for VOCs. Trip blanks will be prepared in the laboratory using deionized water and shipped to the site in sealed sample containers. They will remain capped in the field prior to shipment and will be submitted for analysis with the regular soil samples. One trip blank will be included with each shipment of VOC samples to the offsite laboratory.
- **Matrix Spike/Matrix Spike Duplicates (MS/MSD).** MS/MSD samples will be collected at a frequency of 1 per 20 for soil samples that will be submitted to the laboratory for analysis. MS/MSD samples will be identified in the field and identified on the sample chain-of-custody. The MS/MSD sample will be analyzed for the same parameters as the original sample. For soil, the MS/MSD can be collected from the brass sleeve or jar at the laboratory. Additional soil volume is not required.

4.2.3 Quality Control Data Packages

A Level 2 QC laboratory data package will be required for all laboratory analysis. A Level 2 package includes documentation discussed in the QAPP. The Level 2 QA/QC packages will be evaluated as outlined in the project QAPP (Jacobs, 2019b).

4.3 Sample Packaging and Shipment

Most samples will be shipped for delivery to the laboratory.

All soil sample containers will be placed in a sturdy shipping container (a steel-belted or hard-plastic cooler). The following packaging procedure will be used when samples are shipped to a laboratory:

1. When ice is used, secure the drain plug of the cooler with tape to prevent melting ice from leaking out of the cooler. Double bag all ice.
2. Line the bottom of the cooler with bubble wrap to prevent breakage during shipment.
3. Secure bottle/container tops with custody seals.
4. Wrap all glass sample containers in bubble wrap to prevent breakage.
5. Seal all sample containers in plastic zip-lock bags.

All samples will be placed in coolers with the appropriate chain-of-custody forms. All forms will be enclosed in a large plastic bag and affixed to the underside of the cooler lid. Empty space in the cooler will be filled with bubble wrap or Styrofoam peanuts to prevent movement and breakage during shipment. Vermiculite may also be placed in the cooler to absorb any spills. Ice used to cool samples will be double sealed in two zip-closure plastic bags and placed on top and around the samples to chill them to the correct temperature. Each ice chest will be securely taped shut with nylon strapping tape, and custody seals will be affixed to the front, right, and back of each cooler. Analytical data will be managed as described in the APS QAPP (Jacobs, 2019b).

4.4 Sample Documentation

A systematic field sample ID nomenclature has been developed for APS samples collected at APS sites. Consistent nomenclature has been designed to facilitate entry, management, and reporting of field and analytical data for APS.

The field sample ID nomenclature will vary depending on the sampling purpose. Each field sample ID generated must be unique for each environmental sample collected. The field sample ID is limited to 25 characters. This section describes IDs for field samples and QC samples.

4.4.1 Regular Field Sample ID

The following nomenclature is used for regular field samples:

[Site Code]-[Location ID]-[Sample Date]-[Letter Code (optional)]

Where:

Site Code = Single-digit site code given to each site managed by APS. The site code for Douglas is "D."

Location ID = Location that is being sampled, which is determined before sampling in the field, and depth of sample (i.e., B21). If additional borings are drilled, the location will be a sequentially selected number.

Sample Date = Sample collection date in format of "MMDDYY."

Letter Code = This is optional and only to be used if multiple regular samples are collected from the same location; for example, when collecting samples from multiple depths at the same location, use alphabetical letter starting with A to make each sample collected unique.

Example 1: D-B21-2.5-030119 = Arizona Public Service – Douglas, field investigation sample collected from Borehole B-21 at a depth of 2.5 feet bgs on March 1, 2019.

Samples selected for an MS/MSD will be identified on the chain-of-custody form. The sample will be identified using the station code and depth or date as identified previously. In addition to the sample ID,

the acronym “MS/MSD” will be written in the comments field of the chain-of-custody form to identify that the sample has been selected as an MS/MSD.

4.4.2 Quality Assurance/Quality Control Samples

Field QC samples can include field duplicates, equipment blanks, field blanks, ambient blanks, trip blanks and any other type of field QC samples that may be required for sampling. The field sample ID nomenclature to use would be as follows:

[Site Code]-[QC Type Code]##-[Sample Date]

Where:

Site Code = Single-digit site code given to each site managed by APS. The site code for Douglas is “D”.

Field QC Type = Two-digit code for each type of field QC sample that could be collected. Valid values are provided in Table 4-2. This code is followed by a two-digit sequential number starting with 01 to accommodate multiple samples collected on the same day of the same field QC type.

Sample Date = Sample collection date in format of “MMDDYY.”

Example 1: D-SS01-030119 = Arizona Public Service – Douglas, split sample 1 collected on March 1, 2019

Example 2: D-EB02-030119 = Arizona Public Service, Douglas, equipment blank 2 collected on March 1, 2019

4.5 Field Documentation

4.5.1 Field Log Books

Field log books will be used to document where, when, how, and from whom any vital project information was obtained. Log book entries will be complete and accurate enough to permit reconstruction of field activities. Log books are to be bound with consecutively numbered pages. Each page will be dated and the time of entry noted in military time. All entries will be legible, written in black or blue ink, and signed by the individual making the entries. Language will be factual, objective, and free of personal opinions or other terminology that might prove inappropriate.

At a minimum, the following information will be recorded during the collection of each sample:

- Sample location and description
- Depth of sample for borings and trenches
- Location of trench and boring (measurement from a permanent fixed point and GPS locations)
- Notation if photograph(s) are taken and photograph number
- Site sketch showing sample location and measured distances, if not otherwise clear
- Sampler's name(s)
- Date and time of sample collection
- Designation of sample as composite or grab
- Type of sample (i.e., matrix)
- Type of sampling equipment used

- Onsite measurement data (e.g., temperature, pH, conductivity) (may be collected in a separate field sampling diary)
- Field observations and details important to analysis or integrity of samples (e.g., heavy rains, odors, colors)
- Preliminary sample descriptions (e.g., for soils: clay loam, very wet; for groundwater: clear water with no petroleum-like odor)
- Type(s) of preservation used or present in sample container
- Instrument reading and units of measurement (e.g., pH units, $\mu\text{S}/\text{cm}$, nephelometric turbidity unit)
- Lot numbers of the sample containers, sample tag numbers, chain-of-custody form numbers, and chain-of-custody seal numbers
- Shipping arrangements (overnight air bill number)
- Recipient laboratory

In addition, the following information will be recorded in the field log book for each day of sampling:

- Team members and their responsibilities
- Time of site arrival/entry onsite and time of site departure
- Other personnel onsite
- A summary of any meetings or discussions with APS employees
- A summary of any meetings or discussions with the public, a city employee, or others
- Deviations from sampling plan, site safety plan, or QAPP procedures
- Changes in personnel or responsibilities, as well as the reason for the change
- Levels of safety protection
- Calibration readings for any equipment used and equipment model and serial number

4.5.2 Chain-of-Custody Records

A chain-of-custody record will be used to document sample collection and shipment to a laboratory for sample analysis. A chain-of-custody form will be completed for each cooler of samples shipped to a laboratory. The chain-of-custody record will identify the contents of the shipment and maintain the custodial integrity of the samples. Generally, a sample is considered to be in someone's custody if it is in someone's physical possession, in someone's view, locked up, or kept in a secured area that is restricted to authorized personnel. The site leader or designee will sign the chain-of-custody record. The site leader or designee will sign the "relinquished by" box and note the date, time, and air bill number (if samples are shipped).

4.5.3 Photographs

Photographs will be taken at various sample locations and at other areas of interest onsite. They will serve to verify the information entered in the field log book. When a photograph is taken, the following information will be written in the log book or recorded in a separate photograph field log:

- Photograph number
- Time, date, location, and, if appropriate, weather conditions
- Description of the subject of the photograph
- Name of person taking the photograph

5. Public Notice and Public Participation

APS has a community relations and ongoing public involvement program planned for the Site. During implementation of this work plan, APS will prepare Site-specific newsletters in both English and Spanish. The newsletters will be distributed to the neighboring residents, businesses, community leaders, and border patrol agents and it will be posted at the pedestrian walkway to the east of the Site. APS will brief its employees, community leaders, and city staff.

During the remedial planning phase of the project, APS will complete the ADEQ-required public notice, as specified in Arizona Revised Statute (A.R.S.) §49-176, and other proactive public participation activities, which will be included in the RAP submitted to ADEQ.

Tables

Table 1-1. Summary of Operational History
APS Douglas Former MGP Site, Douglas, Arizona

| Year | Site Structure | Site Activities |
|-----------|--|--|
| 1905-1908 | No information available. | Manufactured gas operations began between 1905 and 1908 and continued until the 1930s ¹ . |
| 1929 | Generator house, one large purifier, two small purifiers, a meter house, a steel crude oil tank, two gas holders, and a concrete shed ² . | Manufactured gas operations continued at the Site. ^{1,2} |
| 1930 | | Arizona Edison Company controlled by Peoples Light and Power Corporation. Annual Production 51.5377 million cubic feet and annual sales 43.9241 million cubic feet. ³ |
| 1938 | | Arizona Edison Company (natural) Natural gas purchased from El Paso Natural Gas Company for resale. Annual sales 115.9389 million cubic feet. ³ Supplies Douglas. |
| 1940 | | Arizona Edison Company Inc. natural gas purchased from El Paso Natural Gas Company for resale. Annual sales 135.4454 million cubic feet. ³ Supplies Douglas. |
| 1944-1947 | Concrete shed, large purifier, and possibly the meter house. ^{1,2} Remaining site structures are not indicated on the 1947 Sanborn map. | Manufactured gas operations were discontinued prior to 1947. Annual gas production ranged from 13.7 million cubic feet in 1910 to 51.5 million cubic feet in 1930. ^{1,3} |
| 1945 | | Arizona Edison Company Inc. natural gas purchased from El Paso Natural Gas Company for resale. Annual sales 215.9795 million cubic feet. ³ Supplies Douglas. |
| 1950 | | Arizona Edison Company Inc. natural gas purchased from El Paso Natural Gas Company for resale. Annual sales 584.7239 million cubic feet. ³ Supplies Douglas. |
| 1995 | Concrete shed, large purifier, concrete foundations from the two gas holders and generator house, and a 2-foot-deep sump associated with the steel crude oil tank. | Site investigation performed from October 1995 to June 1996. The contents of the oil sump and debris from the purifier were characterized in addition to surface and subsurface soil samples. ¹ |
| 1996 | Oil sump contents and sump; purifier contents and purifier; debris pile; concrete shed; and surface soil. | Materials removed from Site based on Arcadis/Geraghty & Miller, <i>Material Removal Activities Former Manufactured Gas Plant, Douglas, Arizona</i> (June 5, 1998). ⁴ |

Notes:

¹ ft bgs = feet below ground surface

² mg/kg = milligram(s) per kilogram

³ Residential SRLs represent the value for 10⁻⁶ carcinogenic risk for compounds identified as carcinogens in Appendix A of Title 18, Chapter 7.

⁴ Cells highlighted in yellow indicate that the compound exceeded the 2007 residential soil remediation level (SRL).

⁵ Cells highlighted in red indicate the compound exceeded the 2007 non-residential SRL.

⁶ NE = Standard not established

⁷ -- = Sample not analyzed for this compound

U = The analyte was analyzed for, but was not detected above, the reported sample quantitation limit.

UJ = The analyte was analyzed for, but was not detected above, the reported sample quantitation limit. However, the reported quantitation limit is approximate and may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

D = Sample was diluted for analysis

Notes:

¹ ft bgs = feet below ground surface

² mg/kg = milligram(s) per kilogram

³ -- = Sample not analyzed for this compound

⁴ Sludge sample was collected for waste disposal purposes. Metals reported in milligrams per liter; benzene, toluene, ethylbenzene, and xylene reported in micrograms per liter.

⁵ Sampling location indicates area surrounding former October 1995 sampling Location (SS-x) where composite sample was collected.

⁶ Composite sample from areas surrounding SS-4 and SS-7.

⁷ Composite sample from areas surrounding SS-11 and S-S12.

⁸ Sample COMP is a composite sample of samples collected at the Site on 6/1/1996.

U = The analyte was analyzed for, but was not detected above, the reported sample quantitation limit.

UJ = The analyte was analyzed for but was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

Notes:

¹ ft bgs = feet below ground surface

² mg/kg = milligram(s) per kilogram

³ Cells highlighted in yellow indicate that the compound exceeded the 2007 residential soil remediation level (SRL).

⁴ Cells highlighted in red indicate the compound exceeded the 2007 non-residential SRL.

⁵ Sludge sample was collected for waste disposal purposes. Benzene, toluene, ethylbenzene, and xylene reported in micrograms per liter. VOCs were analyzed for and not detected in the Sludge sample.

⁶ Sampling location indicates area surrounding former October 1995 sampling Location (SS-x) where composite sample was collected.

⁷ Composite sample from areas surrounding SS-4 and SS-7

⁸ Composite sample from areas surrounding SS-11 and S-S12

⁹ Sample COMP is a composite sample of samples collected at the Site on 6/1/1996

U = The analyte was analyzed for, but was not detected above, the reported sample quantitation limit.

UJ = The analyte was analyzed for, but was not detected above, the reported sample quantitation limit.

However, the reported quantitation limit is approximate and may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

Table 2-4. Summary of Historical Analytical Data for Soil – Metals and Reactive Sulfide

APS Douglas Former MGP Site, Douglas, Arizona

| Location | Sample ID | Sample Type | Sample Date | Depth (ft bgs) ¹ | Units ² | Arsenic | Barium | Cadmium | Chromium | Lead | Mercury | Selenium | Silver | Cyanide | Reactive Sulfide |
|-----------------------------------|--------------|-------------|-------------|-----------------------------|--------------------|---------|--------|---------|----------|------|---------|----------|--------|---------|------------------|
| Residential SRLs ³ | | | | | mg/kg | 10 | 15000 | 39 | 120000 | 400 | 23 | 390 | 390 | 1200 | NA |
| Non-Residential SRLs ⁴ | | | | | mg/kg | 10 | 170000 | 510 | 1000000 | 800 | 310 | 5100 | 5100 | 12000 | NA |
| SS-4/SS-7 Area | SS4-7 | Composite | 08/21/96 | >1 | mg/kg | 15 | -- | -- | -- | 50 | -- | -- | -- | -- | -- |
| SS-5 Area ⁷ | SS5 Comp | Composite | 08/19/96 | >1 | mg/kg | 18 | -- | -- | -- | 11 | -- | -- | -- | -- | -- |
| SS-6 Area - E | SS6E Comp | Composite | 08/19/96 | >1 | mg/kg | 18 | -- | -- | -- | 11 | -- | -- | -- | -- | -- |
| SS-6 Area - W | SS6W Comp | Composite | 08/19/96 | >1 | mg/kg | 24 | -- | -- | -- | 217 | -- | -- | -- | -- | -- |
| SS-6 Area - C | SS6CENT Comp | Composite | 08/19/96 | >1 | mg/kg | 23 | -- | -- | -- | 199 | -- | -- | -- | -- | -- |
| PUR N | PUR N | Composite | 08/21/96 | Surface | mg/kg | 11 | -- | -- | -- | 91 | -- | -- | -- | -- | -- |
| Purifier | Subpurifier | Composite | 08/21/96 | Below Pad | mg/kg | 15 | -- | -- | -- | 15 | -- | -- | -- | -- | -- |

Notes:

¹ ft bgs = feet below ground surface

² mg/kg = milligram(s) per kilogram

³ Cells highlighted in yellow indicate that the compound exceeded the 2007 residential soil remediation level (SRL).

⁴ Cells highlighted in red indicate the compound exceeded the 2007 non-residential SRL.

⁵ -- = Sample not analyzed for this compound.

⁶ Sludge sample was collected for waste disposal purposes. Metals reported in milligrams per liter.

⁷ Sampling location indicates area surrounding former October 1995 sampling Location (SS-x) where composite sample was collected. Results presented as total metals/TCLP metals.

⁸ Composite sample from areas surrounding SS-4 and SS-7

⁹ Composite sample from areas surrounding SS-11 and S-S12

¹⁰ Sample COMP is a composite sample of samples collected at the Site on 6/1/1996

U = The analyte was analyzed for, but was not detected above, the reported sample quantitation limit.

UJ = The analyte was analyzed for, but was not detected above, the reported sample quantitation limit. However, the reported quantitation limit is approximate and may not represent the actual limit of quantitation

T = toxicity characteristic leaching procedure (TCLP) used

Notes:

¹ Sample collected immediately under foundation structure or concrete pad.² Analytical sample held for pending analysis.³ Surface soil samples collected prior to drill rig mobilization.⁴ If groundwater is encountered, monitoring wells will be installed and groundwater samples will be collected and analyzed for polynuclear aromatic hydrocarbons (PAHs) (EPA Method 8310), benzene, toluene, ethylbenzene, and xylenes (BTEX) (EPA Method 8221B), Metals (EPA Method 200.7), and total volatile organic compounds (VOCs) (EPA Method 8260B). A notice of intent will be submitted to the Arizona Department of Water Resources using form 55-43B.

EPA = U.S. Environmental Protection Agency

FOC = fraction organic carbon

PCB = polychlorinated biphenyl

Table 4-1. Summary of Sample Handling Requirements*APS Douglas Former MGP Site, Douglas, Arizona*

| Analyte | Method | Matrix | Container Type | Preservative |
|--|----------------------|------------------------------|--|--------------|
| Soil Analyses | | | | |
| Chemical Analysis | | | | |
| PAH | EPA 8310 or 8270 SIM | Soil | One 8 oz. glass jar or brass sleeve | 4°C |
| Total VOCs (BTEX) | EPA 8260B | Soil | Methanol Kit (10 grams soil/10 mL MeOH) or Encore | Methanol/4°C |
| Total Cyanide | EPA 9013/9014 | Soil | One 8 oz. glass jar or brass sleeve | 4°C |
| Fraction Organic Carbon | ASTM D4129-05 | Soil | One 8 oz. glass jar or brass sleeve | 4°C |
| Geotechnical Analysis | | | | |
| Moisture Content | | Soil | Brass sleeve or Grab | None |
| % Passing 200 Sieve | | Soil | Brass sleeve or Grab | None |
| Atterberg Limit | | Soil | Brass sleeve or Grab | None |
| In Situ Density | | Soil | Brass sleeve | None |
| Shear Strength | | Soil | Brass sleeve | None |
| Dry Bulk Density | | Soil | Brass sleeve | None |
| Waste Characterization and Investigation-derived Waste (IDW) Analyses | | | | |
| PAH | EPA 8310 or 8270 SIM | Solid Liquid ¹ | One 8 oz. glass jar or brass sleeve Two 500-ml amber glass jars | 4°C 4°C |
| RCRA 8 Total Metals | EPA 6010B/7471A | Soil | One 8 oz. glass jar or brass sleeve | 4°C |
| Total Cyanide | EPA 9013/9014 | Solid | One 8 oz. glass jar or brass sleeve | 4°C |
| PCB | EPA 8082 | Solid | One 8 oz. glass jar or brass sleeve | 4°C |
| Total VOCs | EPA 8260B | Soil | Methanol Kit (10 grams soil/10 mL MeOH) or Encore | Methanol/4°C |
| | | Liquid ¹ | Three 40-mL VOA vials | HCL/4°C |
| Corrosivity by pH | EPA 9045B | Solid | One 8 oz. glass jar or brass sleeve | 4°C |
| | | Liquid ¹ | One 500 mL poly | 4°C |
| Paint Filter | EPA 9095 | Solid | One 8 oz. glass jar or brass sleeve | 4°C |
| Ignitability | SW846 Article 7.1.2 | Solid | One 8 oz. glass jar or brass sleeve | 4°C |
| | | Liquid ¹ | Three 40-mL VOA vials | 4°C |

Notes:

¹ Liquid Environmental Solutions will sample and analyze IDW water

°C = degrees Celsius

BTEX = benzene, toluene, ethylbenzene, and xylenes

EPA = U.S. Environmental Protection Agency

HCL = hydrochloric acid

HNO₃ = nitric acid

MeOH = methanol

mL = milliliter(s)

NaOH = sodium hydroxide

oz. = ounce

PAH = polynuclear aromatic hydrocarbon

PCB = polychlorinated biphenyl

RCRA = Resource Conservation and Recovery Act

VOA = volatile organic analysis

VOC = volatile organic compound

CODING OF FIRE-RESISTIVE STRUCTURAL UNITS FOR FIREPROOF AND NON-COMBUSTIBLE BUILDINGS

GLOSSARY

| FRAMING | | FLOORS | | ROOF | |
|---------|---|--------|---|------|--|
| CODE | STRUCTURAL UNIT | CODE | STRUCTURAL UNIT | CODE | STRUCTURAL UNIT |
| A. | Reinforced Concrete Frame. | 1. | Reinforced Concrete, Reinforced Concrete with Masonry Units, Pre-cast Concrete or Gypsum Slabs or Planks. | a. | Reinforced Concrete, Reinforced Concrete Masonry Units, Reinforced Gypsum or Pre-cast Concrete or Gypsum Slabs or Planks. |
| B. | Reinforced Concrete Joists, Columns, Beams, Trusses, Arches, Masonry Piers. | 2. | Concrete on Metal Lath, Incombustible Form Boards, Paper-backed Wire Fabric, Steel Deck, or Cellular, Ribbed or Corrugated Steel Units. | b. | Concrete or Gypsum Metal Lath, Incombustible Form Boards, Paper Wire Fabric, Steel Deck or Cellular, Ribbed or Corrugated Steel Units. |
| C. | Protected Steel Frame. | 3. | Open Steel Deck or Grating. | c. | Incombustible Composite Boards with or without Insulation, Masonry or Metal Tiles. |
| D. | Individually Protected Steel Joists, Columns, Beams, Trusses, Arches. | | | d. | Steel Deck, Corrugated Metal or Asbestos Protected Metal with without Insulation. |
| E. | Indirectly Protected Steel Frame. | | | | |
| F. | Indirectly Protected Steel Joists, Columns, Beams, Trusses, Arches. | | | | |
| G. | Unprotected Steel Frame. | | | | |
| H. | Unprotected Steel Joists, Columns, Beams, Trusses, Arches. | | | | |
| I. | Masonry Bearing Walls only. | | | | |

The coding to left, for framing, floor and roof structural units is used in describing the construction of fire-resistive buildings. In addition, reports for fire-resistive buildings will show the date built, wall construction other than brick, and ceiling.

FP - 1932
(CONG)
A-1-a

A fireproof building built in 1932 with concrete walls and reinforced concrete frame, floors and roof.

FPX - 1932
(METAL PANELS)
B-2-a

A fireproof building built in 1932 with metal panel walls, reinforced concrete columns and beams, concrete floors on metal lath and gypsum slab roof; non-combustible ceilings.

NC - 1932
(C. B.)
H-2-d

A noncombustible building built in 1932 with concrete block walls; unprotected steel columns, beams and joists; concrete floors on metal lath and steel deck roof.

MASONRY CONSTRUCTION

Important interior and all exterior masonry walls of all non-residential buildings and residential buildings of five or more dwelling units are shown with weighted (—) lines.

Masonry walls of residential buildings of four dwelling units or less are shown with a standard line and the construction is noted on all buildings diagrammed after July, 1933.

A - B LINES An arbitrary boundary between adjoining sheets.

AL Private garage.

ALY Above.

ALY Below.

ALY Above & Below.

ALY Above & Below (with fire detecting devices which automatically signal central fire department).

AIR COND Air conditioning system employing ducts through floors.

APRON WALL A masonry wall extending 3' or less above foundation.

ASBESTOS Risk not underwritten by State Fire Ins. Companies.

BASMENT A story having its floor below ground & its ceiling at least 4' above ground.

COOK Cook, County, Ill.: A floor of a building near below the first floor. Shown by the symbol it following story height. Sub-basements or sub-cellars, stories below the 1st basement, are shown by the symbol 5H following basement symbol.

CHIMNEY (Applicable to maps in Rocky Mountain & Pacific Coast States)

CL Brick, stone, concrete brick & concrete chimneys.

C.B. Concrete block chimney.

C Non-standard concrete chimney.

T Tile chimney.

P Patent chimney.

IR Iron chimneys.

S Stove pipe.

S.P.V. Stove pipe with patent ventilator.

RESIDENTIAL OCCUPANCY SYMBOLS

D Single family unit or as qualified by a number.

E Multi-family residential building corresponding with local Rating Bureau definition in family units per floor, story height, & separation of entrances.

U Residential building normally occupied by a single family but with 10 or more rooms rented for lodging purposes.

EXCEPTIONS: 6 rooms in Arizona, California, Nevada, Utah & Montana; 5 rooms in Oregon & Washington; 8 rooms in Idaho & Hawaii.

FIRE RESISTIVE CONSTRUCTION SYMBOLS

F.P. Approved masonry walls, floors & roof, interior supports of approved masonry, concrete, and/or protected steel.

F.P.X. F.P. qualifications except interior or sub-standard walls.

N.C. Fire relative with unprotected structural steel units.

WALL A masonry wall having a continuous air space within.

WALL Independent Electric Plant.

WALL Not traversable due to construction of terrace.

WALL A masonry bearing wall with extended ledges to support floors.

WALL Tenanted by industrial occupancies.

WALL Concrete or plaster applied to metal lath on wood studs.

WALL Metal sash & glass.

WALL Streets appearing on records but not open on ground.

WALL Windows overlooking the roof above the corresponding floor of an adjoining building.

WALL Open between ground and first floor.

WALL Masonry reinforcing columns in walls.

WALL Skylights.

WALL Slate attached to wood siding.

WALL Smoke House.

WALL Shown by crossing diagonal lines on diagram.

WALL Suspended ceilings below floor and/or roof beams.

WALL System.

WALL Transformer.

WALL Wood.

WALL Glass Panels

WALL Glass Panels

CODING OF STRUCTURAL UNITS FOR FIREPROOF AND NON-COMBUSTIBLE BUILDINGS

FRAMING
CODE STRUCTURAL UNIT

- Reinforced Concrete Frame.
- Reinforced Concrete Joists, Columns, Beams, Trusses, Arches, Masonry Piers.
- Protected Steel Frame.
- Individually Protected Steel Joists, Columns, Beams, Trusses, Arches.
- Indirectly Protected Steel Frame.
- Indirectly Protected Steel Joists, Columns, Beams, Trusses, Arches.
- Unprotected Steel Frame.
- Unprotected Steel Joists, Columns, Beams, Trusses, Arches.
- Masonry Bearing Walls.

FLOORS
CODE STRUCTURAL UNIT

- Reinforced Concrete. Reinforced Concrete with Masonry Units. Pre-cast Concrete or Gypsum Slabs or Planks.
- Concrete on Metal Lath, Incombustible Form Boards, Paper-backed Wire Fabric, Steel Deck, and Cellular, Ribbed or Corrugated Steel Units.
- Open Steel Deck or Grating.

LAND USE CODE APPLICABLE TO CHANGES DIAGRAMMED AFTER 3/1/62

| | | | |
|----|-------------------------|---|-------------------------|
| R | RESIDENTIAL | M | MANUFACTURING |
| RT | RESIDENTIAL - TRANSIENT | P | PUBLIC OR INSTITUTIONAL |
| C | COMMERCIAL | U | UTILITY |
| W | WAREHOUSE | T | TRANSPORTATION |

NUMERICAL PREFIX INDICATES THE NUMBER OF ESTABLISHMENTS IN EACH CATEGORY

ROOF
CODE STRUCTURAL UNIT

- Reinforced Concrete. Reinforced Concrete with Masonry Units. Reinforced Gypsum Concrete. Pre-cast Concrete or Gypsum Slabs or Planks.
- Concrete or Gypsum on Metal Lath, Incombustible Form Boards, Paper-backed Wire Fabric, Steel Deck, and Cellular, Ribbed or Corrugated Steel Units.
- Incombustible Composition Boards with or without Insulation. Masonry or Metal Tiles.
- Steel Deck, Corrugated Metal or Asbestos Protected Metal with or without Insulation.

The coding for framing, floor and roof structural units as shown above is used in describing the construction of fire-resistive buildings. In addition, reports for fire-resistive buildings will show the date built and wall construction when other than brick.

F P buildings have masonry floors and roof; concrete and/or directly or indirectly protected steel framing; and clay brick, stone or poured concrete walls.

F P X buildings are F P buildings with inferior walls such as concrete block, cement brick, metal or glass panels, etc.

N C buildings have unprotected steel framing and fire-resistive but non-masonry floors and roof.

F P-1962
(CONC.)
A-1-a

A fire-resistive building built in 1962 with concrete walls and reinforced concrete frame, floors and roof.

F P X-1962
(METAL PANELS)
E-2-b
NONCOMB CEIL'S

A fire-resistive building built in 1962 with metal panel walls, indirectly protected steel frame, concrete floors and roof on metal lath, noncombustible ceilings.

N C-1962
(C.B.)
H-2-d

A noncombustible building built in 1962 with concrete block walls; unprotected steel columns and beams; concrete floors on metal lath and steel deck roof.

A hand-drawn sketch of a building layout. It features a rectangular main structure with a smaller rectangular extension on the left side. The main structure is labeled "Gener. HO." in the center. To the right of the main structure, there is a circular area labeled "11th" and "H". Above the main structure, there is a circular area labeled "10th" and "DIA". To the left of the main structure, there is a rectangular area labeled "10th" and "DIA". The sketch includes various lines, arrows, and handwritten notes, suggesting a detailed architectural or site plan.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.

Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal RCRA generators list

RCRA-CESQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

A review of the RCRA-CESQG list, as provided by EDR, and dated 03/01/2018 has revealed that there are 2 RCRA-CESQG sites within approximately 0.25 miles of the target property.

State and tribal leaking storage tank lists

LUST: The Leaking Underground Storage Tank Incident Reports contain an inventory of reported leaking underground storage tank incidents. The data come from the Department of Environmental Quality's LUST File Listing by Zip Code.

A review of the LUST list, as provided by EDR, and dated 09/07/2018 has revealed that there are 4 LUST sites within approximately 0.5 miles of the target property.

State and tribal registered storage tank lists

UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the Department of Environmental Quality's Arizona UST-DMS Facility and Tank Data Listing by City database.

A review of the UST list, as provided by EDR, and dated 09/07/2018 has revealed that there are 4 UST sites within approximately 0.25 miles of the target property.

AUL: DEUR and VEMUR sites. DEUR: Declaration of Environmental Use Restriction. A restrictive land use covenant that is required when a property owner elects to use an institutional (i.e., administrative) control or engineering (i.e., physical) control as a means to meet remediation goals. The DEUR runs with and burdens the land, and requires maintenance of any institutional or engineering controls. VEMUR: Voluntary Environmental Mitigation Use Restriction. A restrictive land use covenant that, prior to July 18, 2000, was required when a property owner elected to remediate the property to non-residential uses. Effective July 18, 2000, the DEUR replaced the VEMUR as a restrictive use covenant.

A review of the AUL list, as provided by EDR, and dated 08/07/2018 has revealed that there are 2 AUL sites within approximately 0.5 miles of the target property.

ADDITIONAL ENVIRONMENTAL RECORDS

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 03/01/2018 has revealed that there is 1 RCRA NonGen / NLR site within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

A review of the EDR MGP list, as provided by EDR, has revealed that there is 1 EDR MGP site within approximately 1 mile of the target property.

| <u>Lower Elevation</u> | <u>Address</u> | <u>Direction / Distance</u> | <u>Map ID</u> | <u>Page</u> |
|------------------------|------------------|-----------------------------|---------------|-------------|
| DOUGLAS GAS CORPORAT | PAN AMERICAN AVE | 0 - 1/8 (0.000 mi.) | 1 | 8 |

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there is 1 EDR Hist Auto site within approximately 0.125 miles of the target property.

Appendix D

Soil Boring Logs

KEY TO BORING LOG SYMBOLS

| MAJOR DIVISIONS | | | GRAPH SYMBOL | LETTER SYMBOL | DESCRIPTIONS |
|---|---|---------------------------------------|--------------|---|--|
| COARSE GRAINED SOILS (>50% BY WEIGHT LARGER THAN #200 SIEVE) | GRAVELS MORE THAN 50% OF COARSE FRACTION IS LARGER THAN THE NO. 4 SIEVE SIZE | CLEAN GRAVELS WITH LITTLE OR NO FINES | | GW | WELL-GRADED GRAVELS, GRAVEL-SAND MIXTURES |
| | | | | GP | POORLY-GRADED GRAVELS, GRAVEL-SAND MIXTURES |
| | | GRAVEL WITH OVER 12% FINES | | GM | SILTY GRAVELS, GRAVEL-SAND-SILT MIXTURES |
| | | | | GC | CLAYEY GRAVELS, GRAVEL-SAND-CLAY MIXTURES |
| | SANDS MORE THAN 50% OF COARSE FRACTION IS SMALLER THAN NO. 4 SIEVE SIZE | CLEAN SAND WITH LITTLE OR NO FINES | | SW | WELL-GRADED SANDS, GRAVELLY SANDS |
| | | | | SP | POORLY-GRADED SANDS, GRAVELLY SANDS |
| | | SAND WITH OVER 12% FINES | | SM | SILTY SANDS, POORLY GRADED SAND-SILT MIXTURES |
| | | | | SC | CLAYEY SANDS, POORLY GRADED SAND-CLAY MIXTURES |
| FINE GRAINED SOILS (>50% SMALLER THAN #200 SIEVE SIZE). | SILTS AND CLAYS (LIQUID LIMIT <u>LESS</u> THAN 50) | | ML | INORGANIC SILTS AND VERY FINE SANDS, SILTY OR CLAYEY FINE SANDS | |
| | | | CL | INORGANIC CLAYS OF LOW TO MEDIUM PLASTICITY, GRAVELLY, SANDY OR SILTY CLAYS. LEAN CLAYS | |
| | | | OL | ORGANIC SILTS AND ORGANIC SILTY CLAYS OF LOW PLASTICITY | |
| | SILTS AND CLAYS (LIQUID LIMIT <u>GREATER</u> THAN 50) | | MH | INORGANIC SILTS, MICACEOUS OR DIATOMACEOUS FINE SANDY OR SILTY SOILS | |
| | | | CH | INORGANIC CLAYS OF HIGH PLASTICITY, FAT CLAYS | |
| | | | OH | ORGANIC CLAYS OF MEDIUM TO HIGH PLASTICITY, ORGANIC SILTS | |
| HARD PAN SOILS | | | | HP | CALICHE AND OTHER IMPERVIOUS LAYERS |

Stabilized water level (date)

Water level encountered during drilling

PID Photo-ionization Detector

FID Flame-ionization Detector

EXP Gastech Explosimeter

Asphaltic Concrete

Portland Cement Concrete

Cement Grout

Soil sample depth interval (blackened interval indicates portion of sample prepared for laboratory chemical analysis.)

DEGREE OF VERTICAL refers to the angle at which the boring is drilled with respect to a plumb line.

Project Address: Miami, AZ

Judy Heywood:

We are reporting to you the results of the analyses performed on the samples received under the project name referenced above and identified with the XENCO Report Number(s) 641446. All results being reported under this Report Number apply to the samples analyzed and properly identified with a Laboratory ID number. Subcontracted analyses are identified in this report with either the NELAC certification number of the subcontract lab in the analyst ID field, or the complete subcontracted report attached to this report.

Unless otherwise noted in a Case Narrative, all data reported in this Analytical Report are in compliance with NELAC standards. The uncertainty of measurement associated with the results of analysis reported is available upon request. Should insufficient sample be provided to the laboratory to meet the method and NELAC Matrix Duplicate and Matrix Spike requirements, then the data will be analyzed, evaluated and reported using all other available quality control measures.

The validity and integrity of this report will remain intact as long as it is accompanied by this letter and reproduced in full, unless written approval is granted by XENCO Laboratories. This report will be filed for at least 5 years in our archives after which time it will be destroyed without further notice, unless otherwise arranged with you. The samples received, and described as recorded in Report No. 641446 will be filed for 45 days, and after that time they will be properly disposed without further notice, unless otherwise arranged with you. We reserve the right to return to you any unused samples, extracts or solutions related to them if we consider so necessary (e.g., samples identified as hazardous waste, sample sizes exceeding analytical standard practices, controlled substances under regulated protocols, etc).

We thank you for selecting XENCO Laboratories to serve your analytical needs. If you have any questions concerning this report, please feel free to contact us at any time.

Respectfully,

A handwritten signature in black ink, appearing to read 'Ruriko Konuma', is written over a horizontal line.

CASE NARRATIVE

Client Name: APS

Project Name: APS MGP Douglas, AZ

Project ID: D3118600.A.CS.EV.DG.0.
Work Order Number(s): 641446

Report Date: 11.18.2019
Date Received: 10.30.2019

Sample receipt non conformances and comments:

None

Sample receipt non conformances and comments per sample:

None

Analytical non conformances and comments:

Batch: LBA-3105931 Volatiles by SW 8260C

Lab Sample ID 641446-029 was randomly selected for Matrix Spike/Matrix Spike Duplicate (MS/MSD). Bromomethane, Chloroethane recovered below QC limits in the Matrix Spike and Matrix Spike Duplicate. Bromoform recovered below QC limits in the Matrix Spike Duplicate. Outlier/s are due to possible matrix interference. Samples in the analytical batch are: 641446-014, -019, -029, -034, -037, -038, -039. The Laboratory Control Sample for Bromomethane, Chloroethane, Bromoform is within laboratory Control Limits, therefore the data was accepted.

Batch: LBA-3106008 PAHs by 8270D SIM

Samples in work order 641446 were run at dilution due to the physical characteristics of the samples--dark and viscous.

Batch: LBA-3106011 PAHs by 8270D SIM

Acenaphthylene, Anthracene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Chrysene, Fluoranthene, Pyrene Relative Percent Difference (RPD) between matrix spike and duplicate were above quality control limits.

Samples in the analytical batch are: 641446-022, -023, -024, -025, -026, -027, -028, -029, -030, -031, -032, -033, -034, -035, -036, -037, -038, -039, -040

Lab Sample ID 641446-029 was randomly selected for Matrix Spike/Matrix Spike Duplicate (MS/MSD). Anthracene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Chrysene, Fluoranthene, Pyrene recovered above QC limits in the Matrix Spike Duplicate. Outlier/s are due to possible matrix interference. Samples in the analytical batch are: 641446-022, -023, -024, -025, -026, -027, -028, -029, -030, -031, -032, -033, -034, -035, -036, -037, -038, -039, -040.

The Laboratory Control Sample for Anthracene, Benzo(k)fluoranthene, Chrysene, Pyrene, Benzo(b)fluoranthene, Fluoranthene is within laboratory Control Limits, therefore the data was accepted.

Surrogate Terphenyl-D14 recovered above QC limits. Matrix interferences is suspected; data confirmed by re-analysis.

Samples affected are: 641446-023.

Samples in work order 641446 were run at dilution due to the physical characteristics of the samples--dark and viscous.

CASE NARRATIVE

Client Name: APS

Project Name: APS MGP Douglas, AZ

Project ID: D3118600.A.CS.EV.DG.0.
Work Order Number(s): 641446

Report Date: 11.18.2019
Date Received: 10.30.2019

Batch: LBA-3106129 Metals, RCRA List, by SW 6020

Lab Sample ID 641446-001 was randomly selected for Matrix Spike/Matrix Spike Duplicate (MS/MSD). Barium recovered below QC limits in the Matrix Spike and Matrix Spike Duplicate. Outlier/s are due to possible matrix interference. Samples in the analytical batch are: 641446-001, -002, -003, -004, -005, -006, -007, -008, -009, -010, -011, -012, -013, -014, -015, -016, -017, -018, -020.

The Laboratory Control Sample for Barium is within laboratory Control Limits, therefore the data was accepted.

Batch: LBA-3106155 Metals, RCRA List, by SW 6020

Lab Sample ID 641446-029 was randomly selected for Matrix Spike/Matrix Spike Duplicate (MS/MSD). Barium recovered below QC limits in the Matrix Spike and Matrix Spike Duplicate. Lead recovered below QC limits in the Matrix Spike Duplicate. Outlier/s are due to possible matrix interference. Samples in the analytical batch are: 641446-021, -022, -023, -024, -025, -026, -027, -028, -029, -030, -031, -032, -033, -034, -035, -036, -037, -038, -039, -040.

The Laboratory Control Sample for Barium, Lead is within laboratory Control Limits, therefore the data was accepted.

Flagging Criteria

Flags

All method blanks, laboratory spikes, and/or matrix spikes met quality control objectives for the parameters associated with this Work Order except as detailed below or on the Data Qualifier page of this report. Data Qualifiers used in this report are in accordance with ADHS Data Qualifiers, Revision 4.0 9/05/2012.

Data qualifiers (flags) contained within this analytical report have been issued to explain a quality control deficiency, and do not affect the quality (validity) of the data unless noted otherwise in the case narrative.

Notice: Signature of this document and relinquishment of samples constitutes a valid purchase order from client company to Xenco, its affiliates and subcontractors. It assigns standard terms and conditions of service. Xenco will be liable only for the cost of samples and shall not assume any responsibility for any losses or expenses incurred by the client if such losses are due to circumstances beyond the control of Xenco. A minimum charge of \$75.00 will be applied to each project and a charge of \$5 for each sample submitted to Xenco, but not analyzed. These terms will be enforced unless previously negotiated.

Notice: Signature of this document and relinquishment of samples constitutes a valid purchase order from client company to Xenco, its affiliates and subcontractors. It assigns standard terms and conditions of service. Xenco will be liable only for the cost of samples and shall not assume any responsibility for any losses or expenses incurred by the client if such losses are due to circumstances beyond the control of Xenco. A minimum charge of \$75.00 will be applied to each project and a charge of \$5 for each sample submitted to Xenco, but not analyzed. These terms will be enforced unless previously negotiated.

Prelogin/Nonconformance Report- Sample Log-In

Client: APS

Date/ Time Received: 10/30/2019 10:00:00 AM

Work Order #: 641446

Acceptable Temperature Range: 0 - 6 degC

Air and Metal samples Acceptable Range: Ambient

Temperature Measuring device used : HOU-068

Sample Receipt Checklist

Comments

| | |
|---|-----|
| #1 *Temperature of cooler(s)? | 1.3 |
| #2 *Shipping container in good condition? | Yes |
| #3 *Samples received on ice? | Yes |
| #4 *Custody Seals intact on shipping container/ cooler? | Yes |
| #5 Custody Seals intact on sample bottles? | N/A |
| #6 *Custody Seals Signed and dated? | Yes |
| #7 *Chain of Custody present? | Yes |
| #8 Any missing/extra samples? | No |
| #9 Chain of Custody signed when relinquished/ received? | Yes |
| #10 Chain of Custody agrees with sample labels/matrix? | Yes |
| #11 Container label(s) legible and intact? | Yes |
| #12 Samples in proper container/ bottle? | Yes |
| #13 Samples properly preserved? | Yes |
| #14 Sample container(s) intact? | Yes |
| #15 Sufficient sample amount for indicated test(s)? | Yes |
| #16 All samples received within hold time? | Yes |
| #17 Subcontract of sample(s)? | No |
| #18 Water VOC samples have zero headspace? | N/A |

*** Must be completed for after-hours delivery of samples prior to placing in the refrigerator**

Judy Heywood:

We are reporting to you the results of the analyses performed on the samples received under the project name referenced above and identified with the XENCO Report Number(s) 641801. All results being reported under this Report Number apply to the samples analyzed and properly identified with a Laboratory ID number. Subcontracted analyses are identified in this report with either the NELAC certification number of the subcontract lab in the analyst ID field, or the complete subcontracted report attached to this report.

Unless otherwise noted in a Case Narrative, all data reported in this Analytical Report are in compliance with NELAC standards. The uncertainty of measurement associated with the results of analysis reported is available upon request. Should insufficient sample be provided to the laboratory to meet the method and NELAC Matrix Duplicate and Matrix Spike requirements, then the data will be analyzed, evaluated and reported using all other available quality control measures.

The validity and integrity of this report will remain intact as long as it is accompanied by this letter and reproduced in full, unless written approval is granted by XENCO Laboratories. This report will be filed for at least 5 years in our archives after which time it will be destroyed without further notice, unless otherwise arranged with you. The samples received, and described as recorded in Report No. 641801 will be filed for 45 days, and after that time they will be properly disposed without further notice, unless otherwise arranged with you. We reserve the right to return to you any unused samples, extracts or solutions related to them if we consider so necessary (e.g., samples identified as hazardous waste, sample sizes exceeding analytical standard practices, controlled substances under regulated protocols, etc).

We thank you for selecting XENCO Laboratories to serve your analytical needs. If you have any questions concerning this report, please feel free to contact us at any time.

Respectfully,

A handwritten signature in black ink, appearing to read 'Ruriko Konuma', is written over a horizontal line.

CASE NARRATIVE

Client Name: APS

Project Name: APS MPG Douglas, AZ

Project ID: D3118600.A.CS>EV.DG.t
Work Order Number(s): 641801

Report Date: 11.21.2019
Date Received: 11.01.2019

Sample receipt non conformances and comments:

Revised report due to TCLP Metals Analysis added to sample ID: D-B11-2.5-3.0 sample Work Order number 641801-022 Analysis requested by Matthew Branche via email on 11/17/2019 @ 12:02pm

Sample receipt non conformances and comments per sample:

None

Analytical non conformances and comments:

Batch: LBA-3106302 PAHs by 8270D SIM

Phenanthrene Relative Percent Difference (RPD) between matrix spike and duplicate was above quality control limits.

Samples in the analytical batch are: 641801-023, -024, -025, -026, -027, -028, -029, -030, -031, -032, -033, -034, -035, -036, -037, -038, -040, -041

Lab Sample ID 641801-026 was randomly selected for Matrix Spike/Matrix Spike Duplicate (MS/MSD). Fluoranthene recovered below QC limits in the Matrix Spike. Benzo(a)anthracene , Benzo(a)pyrene , Benzo(b)fluoranthene , Benzo(g,h,i)perylene , Chrysene, Indeno(1,2,3-c,d)Pyrene recovered below QC limits in the Matrix Spike and Matrix Spike Duplicate. Phenanthrene recovered above QC limits in the Matrix Spike Duplicate. Outlier/s are due to possible matrix interference. Samples in the analytical batch are: 641801-023, -024, -025, -026, -027, -028, -029, -030, -031, -032, -033, -034, -035, -036, -037, -038, -040, -041.

The Laboratory Control Sample for Chrysene, Pyrene, Benzo(a)pyrene , Benzo(b)fluoranthene , Fluoranthene, Benzo(a)anthracene , Indeno(1,2,3-c,d)Pyrene , Benzo(g,h,i)perylene , Phenanthrene is within laboratory Control Limits, therefore the data was accepted.

Batch: LBA-3106405 Total Metals by SW6020A

Lab Sample ID 641801-026 was randomly selected for Matrix Spike/Matrix Spike Duplicate (MS/MSD). Arsenic, Barium, Chromium, Lead recovered above QC limits in the Matrix Spike and Matrix Spike Duplicate. Outlier/s are due to possible matrix interference. Samples in the analytical batch are: 641801-026, -030, -031, -032, -033, -034, -035, -036, -037, -038, -040, -041, -042, -043.

The Laboratory Control Sample for Arsenic, Chromium, Barium, Lead is within laboratory Control Limits, therefore the data was accepted.

Batch: LBA-3106408 Metals, RCRA List, by SW 6020

Lab Sample ID 641801-018 was randomly selected for Matrix Spike/Matrix Spike Duplicate (MS/MSD). Barium recovered above QC limits in the Matrix Spike. Outlier/s are due to possible matrix interference. Samples in the analytical batch are: 641801-007, -008, -009, -010, -011, -012, -013, -016, -017, -018, -019, -020, -021, -022, -023, -024, -025, -027, -028, -029.

The Laboratory Control Sample for Barium is within laboratory Control Limits, therefore the data was accepted.

CASE NARRATIVE

Client Name: APS

Project Name: APS MPG Douglas, AZ

Project ID: D3118600.A.CS>EV.DG.t
Work Order Number(s): 641801

Report Date: 11.21.2019
Date Received: 11.01.2019

Batch: LBA-3106445 PCBs by SW 8082A

Surrogate Decachlorobiphenyl recovered above QC limits. Matrix interferences is suspected; data confirmed by re-analysis.

Samples affected are: 641882-004 S, 641801-021.

Flagging Criteria

Flags

All method blanks, laboratory spikes, and/or matrix spikes met quality control objectives for the parameters associated with this Work Order except as detailed below or on the Data Qualifier page of this report. Data Qualifiers used in this report are in accordance with ADHS Data Qualifiers, Revision 4.0 9/05/2012.

Data qualifiers (flags) contained within this analytical report have been issued to explain a quality control deficiency, and do not affect the quality (validity) of the data unless noted otherwise in the case narrative.

Notice: Signature of this document and relinquishment of samples constitutes a valid purchase order from client company to Xenco, its affiliates and subcontractors. It assigns standard terms and conditions of service. Xenco will be liable only for the cost of samples and shall not assume any responsibility for any losses or expenses incurred by the client if such losses are due to circumstances beyond the control of Xenco. A minimum charge of \$75.00 will be applied to each project and a charge of \$5 for each sample submitted to Xenco, but not analyzed. These terms will be enforced unless previously negotiated.

Notice: Signature of this document and relinquishment of samples constitutes a valid purchase order from client company to Xenco, its affiliates and subcontractors. It assigns standard terms and conditions of service. Xenco will be liable only for the cost of samples and shall not assume any responsibility for any losses or expenses incurred by the client if such losses are due to circumstances beyond the control of Xenco. A minimum charge of \$75.00 will be applied to each project and a charge of \$5 for each sample submitted to Xenco, but not analyzed. These terms will be enforced unless previously negotiated.

XENCO Laboratories
Prelogin/Nonconformance Report- Sample Log-In

Client: APS

Date/ Time Received: 11.01.2019 09.30.00 AM

Work Order #: 641801

Acceptable Temperature Range: 0 - 6 degC

Air and Metal samples Acceptable Range: Ambient

Temperature Measuring device used : HOU-068

| Sample Receipt Checklist | Comments |
|---|---|
| #1 *Temperature of cooler(s)? | 2.2 |
| #2 *Shipping container in good condition? | Yes |
| #3 *Samples received on ice? | Yes |
| #4 *Custody Seals intact on shipping container/ cooler? | Yes |
| #5 Custody Seals intact on sample bottles? | No |
| #6 *Custody Seals Signed and dated? | Yes |
| #7 *Chain of Custody present? | Yes |
| #8 Any missing/extra samples? | Yes 2 extra MEOH vials with no sample label ID. Extra 8oz. jar, Sample Point 2 designated MS/MSD. Duplicated sample ID on COC no containers for sample point D-B28-10.05-10.5 collected at 15:55 line item 4 on pg 2 of 5 COC. |
| #9 Chain of Custody signed when relinquished/ received? | Yes |
| #10 Chain of Custody agrees with sample labels/matrix? | Yes |
| #11 Container label(s) legible and intact? | Yes |
| #12 Samples in proper container/ bottle? | Yes |
| #13 Samples properly preserved? | Yes |
| #14 Sample container(s) intact? | Yes |
| #15 Sufficient sample amount for indicated test(s)? | Yes |
| #16 All samples received within hold time? | Yes |
| #17 Subcontract of sample(s)? | No |
| #18 Water VOC samples have zero headspace? | N/A |

*** Must be completed for after-hours delivery of samples prior to placing in the refrigerator**

Project Address: Miami, AZ

Judy Heywood:

We are reporting to you the results of the analyses performed on the samples received under the project name referenced above and identified with the XENCO Report Number(s) 641882. All results being reported under this Report Number apply to the samples analyzed and properly identified with a Laboratory ID number. Subcontracted analyses are identified in this report with either the NELAC certification number of the subcontract lab in the analyst ID field, or the complete subcontracted report attached to this report.

Unless otherwise noted in a Case Narrative, all data reported in this Analytical Report are in compliance with NELAC standards. The uncertainty of measurement associated with the results of analysis reported is available upon request. Should insufficient sample be provided to the laboratory to meet the method and NELAC Matrix Duplicate and Matrix Spike requirements, then the data will be analyzed, evaluated and reported using all other available quality control measures.

The validity and integrity of this report will remain intact as long as it is accompanied by this letter and reproduced in full, unless written approval is granted by XENCO Laboratories. This report will be filed for at least 5 years in our archives after which time it will be destroyed without further notice, unless otherwise arranged with you. The samples received, and described as recorded in Report No. 641882 will be filed for 45 days, and after that time they will be properly disposed without further notice, unless otherwise arranged with you. We reserve the right to return to you any unused samples, extracts or solutions related to them if we consider so necessary (e.g., samples identified as hazardous waste, sample sizes exceeding analytical standard practices, controlled substances under regulated protocols, etc).

We thank you for selecting XENCO Laboratories to serve your analytical needs. If you have any questions concerning this report, please feel free to contact us at any time.

Respectfully,

A handwritten signature in black ink, appearing to read 'Ruriko Konuma', is written over a horizontal line.

CASE NARRATIVE

Client Name: APS

Project Name: APS MPG Douglas, AZ

Project ID: D3118600.A.CS.EV.DG.0.
Work Order Number(s): 641882

Report Date: 11.21.2019
Date Received: 11.04.2019

Sample receipt non conformances and comments:

Revised report due to TCLP Metals Analysis added to sample ID: D-B12-7.5-8.0 sample Work Order number 641882-016 Analysis requested by Matthew Branche via email on 11/17/2019 @ 12:02pm

Sample receipt non conformances and comments per sample:

None

Analytical non conformances and comments:

Batch: LBA-3106377 Volatiles by SW 8260C

Sample required dilution due to high concentration of target analyte.

Batch: LBA-3106445 PCBs by SW 8082A

Surrogate Decachlorobiphenyl recovered above QC limits. Surrogate high due to matrix interference.

Samples affected are: 641882-004 S, 641882-015, 641882-012, 641882-004, 641882-014.

Batch: LBA-3106468 Metals, RCRA List, by SW 6020

Lab Sample ID 641882-004 was randomly selected for Matrix Spike/Matrix Spike Duplicate (MS/MSD). Barium recovered below QC limits in the Matrix Spike and Matrix Spike Duplicate. Outlier/s are due to possible matrix interference. Samples in the analytical batch are: 641882-001, -002, -003, -004, -005, -006, -007, -008, -009, -010, -012, -013, -014, -015, -016, -017, -018, -019.

The Laboratory Control Sample for Barium is within laboratory Control Limits, therefore the data was accepted.

CASE NARRATIVE

Client Name: APS

Project Name: APS MPG Douglas, AZ

Project ID: D3118600.A.CS.EV.DG.0.
Work Order Number(s): 641882

Report Date: 11.21.2019
Date Received: 11.04.2019

Batch: LBA-3106513 PAHs by 8270D SIM

Lab Sample ID 641882-004 was randomly selected for Matrix Spike/Matrix Spike Duplicate (MS/MSD). Acenaphthene recovered below QC limits in the Matrix Spike. Acenaphthylene, Anthracene, Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Benzo(g,h,i)perylene, Benzo(k)fluoranthene, Chrysene, Dibenz(a,h)Anthracene, Fluoranthene, Fluorene, Indeno(1,2,3-c,d)Pyrene, Naphthalene, Phenanthrene recovered above QC limits in the Matrix Spike and Matrix Spike Duplicate. Acenaphthene recovered above QC limits in the Matrix Spike Duplicate. Outlier/s are due to possible matrix interference. Samples in the analytical batch are: 641882-001, -002, -003, -004, -005, -006, -007, -008, -009, -010, -012, -013, -014, -015, -016, -017, -018, -019.

The Laboratory Control Sample for Anthracene, Acenaphthylene, Benzo(k)fluoranthene, Chrysene, Dibenz(a,h)Anthracene, Naphthalene, Pyrene, Benzo(a)pyrene, Benzo(b)fluoranthene, Fluoranthene, Acenaphthene, Benzo(a)anthracene, Indeno(1,2,3-c,d)Pyrene, Benzo(g,h,i)perylene, Fluorene, Phenanthrene is within laboratory Control Limits, therefore the data was accepted.

Acenaphthene, Acenaphthylene, Anthracene, Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Benzo(g,h,i)perylene, Benzo(k)fluoranthene, Chrysene, Dibenz(a,h)Anthracene, Fluoranthene, Fluorene, Indeno(1,2,3-c,d)Pyrene, Naphthalene, Phenanthrene Relative Percent Difference (RPD) between matrix spike and duplicate were above quality control limits. Samples in the analytical batch are: 641882-001, -002, -003, -004, -005, -006, -007, -008, -009, -010, -012, -013, -014, -015, -016, -017, -018, -019

Surrogate 2-Fluorobiphenyl recovered above QC limits. Matrix interferences is suspected; Samples affected are: 641882-003.

Surrogate Terphenyl-D14 recovered above QC limits. Matrix interferences is suspected; Samples affected are: 641882-003, 641882-004 S, 641882-004 SD, 641882-016.

Sample 641882-004 were diluted due to the dark and viscous nature of the samples.

Samples in work order 641882 were run at dilution due to the dark and viscous nature of the samples.

Batch: LBA-3106537 Metals, RCRA List, by SW 6020

Lab Sample ID 641882-034 was randomly selected for Matrix Spike/Matrix Spike Duplicate (MS/MSD). Barium recovered below QC limits in the Matrix Spike and Matrix Spike Duplicate. Outlier/s are due to possible matrix interference. Samples in the analytical batch are: 641882-020, -021, -022, -023, -024, -025, -026, -027, -028, -031, -033, -034, -035.

The Laboratory Control Sample for Barium is within laboratory Control Limits, therefore the data was accepted.

CASE NARRATIVE

Client Name: APS

Project Name: APS MPG Douglas, AZ

Project ID: D3118600.A.CS.EV.DG.0.
Work Order Number(s): 641882

Report Date: 11.21.2019
Date Received: 11.04.2019

Batch: LBA-3106545 Total Cyanide by SW 9012

Lab Sample ID 641882-004 was randomly selected for Matrix Spike/Matrix Spike Duplicate (MS/MSD). Cyanide, Total recovered below QC limits in the Matrix Spike and Matrix Spike Duplicate. Outlier/s are due to possible matrix interference. Samples in the analytical batch are: 641882-004, -012, -014, -015. The Laboratory Control Sample for Cyanide, Total is within laboratory Control Limits, therefore the data was accepted.

Batch: LBA-3106591 PAHs by 8270D SIM

Phenanthrene Relative Percent Difference (RPD) between matrix spike and duplicate was above quality control limits.

Samples in the analytical batch are: 641882-020, -021, -022, -023, -024, -025, -026, -027, -028, -029, -030, -031, -032, -033, -034, -035

Lab Sample ID 641882-034 was randomly selected for Matrix Spike/Matrix Spike Duplicate (MS/MSD). Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Benzo(g,h,i)perylene, Chrysene, Fluoranthene, Indeno(1,2,3-c,d)Pyrene, Phenanthrene recovered above QC limits in the Matrix Spike and Matrix Spike Duplicate. Outlier/s are due to possible matrix interference. Samples in the analytical batch are: 641882-020, -021, -022, -023, -024, -025, -026, -027, -028, -029, -030, -031, -032, -033, -034, -035.

The Laboratory Control Sample for Chrysene, Pyrene, Benzo(a)pyrene, Benzo(b)fluoranthene, Fluoranthene, Benzo(a)anthracene, Indeno(1,2,3-c,d)Pyrene, Benzo(g,h,i)perylene, Phenanthrene is within laboratory Control Limits, therefore the data was accepted.

Flagging Criteria

Flags

All method blanks, laboratory spikes, and/or matrix spikes met quality control objectives for the parameters associated with this Work Order except as detailed below or on the Data Qualifier page of this report. Data Qualifiers used in this report are in accordance with ADHS Data Qualifiers, Revision 4.0 9/05/2012.

Data qualifiers (flags) contained within this analytical report have been issued to explain a quality control deficiency, and do not affect the quality (validity) of the data unless noted otherwise in the case narrative.

Notice: Signature of this document and relinquishment of samples constitutes a valid purchase order from client company to Xenco, its affiliates and subcontractors. It assigns standard terms and conditions of service. Xenco will be liable only for the cost of samples and shall not assume any responsibility for any losses or expenses incurred by the client if such losses are due to circumstances beyond the control of Xenco. A minimum charge of \$75.00 will be applied to each project and a charge of \$5 for each sample submitted to Xenco, but not analyzed. These terms will be enforced unless previously negotiated.

APS MGP Douglas, AZ

Project Address:

Judy Heywood:

We are reporting to you the results of the analyses performed on the samples received under the project name referenced above and identified with the XENCO Report Number(s) 642000. All results being reported under this Report Number apply to the samples analyzed and properly identified with a Laboratory ID number. Subcontracted analyses are identified in this report with either the NELAC certification number of the subcontract lab in the analyst ID field, or the complete subcontracted report attached to this report.

Unless otherwise noted in a Case Narrative, all data reported in this Analytical Report are in compliance with NELAC standards. The uncertainty of measurement associated with the results of analysis reported is available upon request. Should insufficient sample be provided to the laboratory to meet the method and NELAC Matrix Duplicate and Matrix Spike requirements, then the data will be analyzed, evaluated and reported using all other available quality control measures.

The validity and integrity of this report will remain intact as long as it is accompanied by this letter and reproduced in full, unless written approval is granted by XENCO Laboratories. This report will be filed for at least 5 years in our archives after which time it will be destroyed without further notice, unless otherwise arranged with you. The samples received, and described as recorded in Report No. 642000 will be filed for 45 days, and after that time they will be properly disposed without further notice, unless otherwise arranged with you. We reserve the right to return to you any unused samples, extracts or solutions related to them if we consider so necessary (e.g., samples identified as hazardous waste, sample sizes exceeding analytical standard practices, controlled substances under regulated protocols, etc).

We thank you for selecting XENCO Laboratories to serve your analytical needs. If you have any questions concerning this report, please feel free to contact us at any time.

Respectfully,

Ruriko Konuma

CASE NARRATIVE

Client Name: APS

Project Name: APS MGP Douglas, AZ

Project ID: D3118600.A.CS.EV.DG.0.
Work Order Number(s): 642000

Report Date: 08-NOV-19
Date Received: 11/05/2019

Sample receipt non conformances and comments:

None

Sample receipt non conformances and comments per sample:

None

Analytical non conformances and comments:

Batch: LBA-3106630 Metals, RCRA List, by SW 6020

Lab Sample ID 642000-015 was randomly selected for Matrix Spike/Matrix Spike Duplicate (MS/MSD). Arsenic recovered above QC limits in the Matrix Spike. Barium, Chromium, Lead recovered above QC limits in the Matrix Spike and Matrix Spike Duplicate. Outlier/s are due to possible matrix interference. Samples in the analytical batch are: 642000-011, -012, -013, -014, -015, -016, -017, -018, -019, -020, -021, -023, -024, -025, -026, -027, -028, -029, -030.

The Laboratory Control Sample for Arsenic, Chromium, Barium, Lead is within laboratory Control Limits, therefore the data was accepted.

Batch: LBA-3106671 PAHs by SW846 8270D SIM

Lab Sample ID 642000-057 was randomly selected for Matrix Spike/Matrix Spike Duplicate (MS/MSD). Benzo(k)fluoranthene, Dibenz(a,h)anthracene, Indeno(1,2,3-c,d)Pyrene recovered below QC limits in the Matrix Spike. Benzo(g,h,i)perylene recovered below QC limits in the Matrix Spike and Matrix Spike Duplicate. Outlier/s are due to possible matrix interference. Samples in the analytical batch are: 642000-057, -058.

The Laboratory Control Sample for Dibenz(a,h)anthracene, Benzo(g,h,i)perylene, Benzo(k)fluoranthene, Indeno(1,2,3-c,d)Pyrene is within laboratory Control Limits, therefore the data was accepted.

Batch: LBA-3106705 Metals, RCRA List, by SW 6020

Lab Sample ID 642000-048 was randomly selected for Matrix Spike/Matrix Spike Duplicate (MS/MSD). Barium recovered below QC limits in the Matrix Spike and Matrix Spike Duplicate. Arsenic recovered above QC limits in the Matrix Spike. Outlier/s are due to possible matrix interference. Samples in the analytical batch are: 642000-031, -032, -035, -036, -037, -038, -039, -040, -041, -042, -043, -044, -045, -046, -047, -048, -049, -050, -051, -052.

The Laboratory Control Sample for Arsenic, Barium is within laboratory Control Limits, therefore the data was accepted.

CASE NARRATIVE

Client Name: APS

Project Name: APS MGP Douglas, AZ

Project ID: D3118600.A.CS.EV.DG.0
Work Order Number(s): 642000

Report Date: 08-NOV-19
Date Received: 11/05/2019

Batch: LBA-3106710 PAHs by 8270D SIM

Fluoranthene, Phenanthrene, Pyrene Relative Percent Difference (RPD) between matrix spike and duplicate were above quality control limits.

Samples in the analytical batch are: 642000-043, -044, -045, -046, -047, -048, -049, -050, -051, -052, -053, -054, -055

Lab Sample ID 642000-048 was randomly selected for Matrix Spike/Matrix Spike Duplicate (MS/MSD). Fluoranthene, Phenanthrene, Pyrene recovered above QC limits in the Matrix Spike Duplicate. Outlier/s are due to possible matrix interference. Samples in the analytical batch are: 642000-043, -044, -045, -046, -047, -048, -049, -050, -051, -052, -053, -054, -055.

The Laboratory Control Sample for Pyrene, Fluoranthene, Phenanthrene is within laboratory Control Limits, therefore the data was accepted.

Sample 642000-048 was run at dilution due to the physical characteristics of the sample (dark and viscous).

Batch: LBA-3106739 PAHs by 8270D SIM

Lab Sample ID 642000-015 was randomly selected for Matrix Spike/Matrix Spike Duplicate (MS/MSD). Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Benzo(g,h,i)perylene, Chrysene, Fluoranthene, Indeno(1,2,3-c,d)Pyrene, Phenanthrene recovered below QC limits in the Matrix Spike Duplicate. Outlier/s are due to possible matrix interference. Samples in the analytical batch are: 642000-001, -002, -003, -004, -005, -006, -007, -008, -009, -010, -011, -012, -013, -014, -015, -016, -017, -018, -019, -020.

The Laboratory Control Sample for Chrysene, Pyrene, Benzo(a)pyrene, Benzo(b)fluoranthene, Fluoranthene, Benzo(a)anthracene, Indeno(1,2,3-c,d)Pyrene, Benzo(g,h,i)perylene, Phenanthrene is within laboratory Control Limits, therefore the data was accepted.

Acenaphthylene, Anthracene, Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Benzo(g,h,i)perylene, Benzo(k)fluoranthene, Chrysene, Fluoranthene, Indeno(1,2,3-c,d)Pyrene, Phenanthrene Relative Percent Difference (RPD) between matrix spike and duplicate were above quality control limits.

Samples in the analytical batch are: 642000-001, -002, -003, -004, -005, -006, -007, -008, -009, -010, -011, -012, -013, -014, -015, -016, -017, -018, -019, -020

Samples in work order 642000 were run at dilution due to the physical characteristics of the sample (dark and very viscous).

Flags

All method blanks, laboratory spikes, and/or matrix spikes met quality control objectives for the parameters associated with this Work Order except as detailed below or on the Data Qualifier page of this report. Data Qualifiers used in this report are in accordance with ADHS Data Qualifiers, Revision 4.0 9/05/2012. Data qualifiers (flags) contained within this analytical report have been issued to explain a quality control deficiency, and do not affect the quality (validity) of the data unless noted otherwise in the case narrative.

APS, Phoenix, AZ

Notice: Signature of this document and relinquishment of samples constitutes a valid purchase order from client company to Xenco, its affiliates and subcontractors. It assigns standard terms and conditions of service. Xenco will be liable only for the cost of samples and shall not assume any responsibility for any losses or expenses incurred by the client if such losses are due to circumstances beyond the control of Xenco. A minimum charge of \$75.00 will be applied to each project and a charge of \$5 for each sample submitted to Xenco, but not analyzed. These terms will be enforced unless previously negotiated.

Reference: XENCO Report No(s): **642303**

APS MGP Douglas, AZ

Project Address:

Judy Heywood:

We are reporting to you the results of the analyses performed on the samples received under the project name referenced above and identified with the XENCO Report Number(s) 642303. All results being reported under this Report Number apply to the samples analyzed and properly identified with a Laboratory ID number. Subcontracted analyses are identified in this report with either the NELAC certification number of the subcontract lab in the analyst ID field, or the complete subcontracted report attached to this report.

Unless otherwise noted in a Case Narrative, all data reported in this Analytical Report are in compliance with NELAC standards. The uncertainty of measurement associated with the results of analysis reported is available upon request. Should insufficient sample be provided to the laboratory to meet the method and NELAC Matrix Duplicate and Matrix Spike requirements, then the data will be analyzed, evaluated and reported using all other available quality control measures.

The validity and integrity of this report will remain intact as long as it is accompanied by this letter and reproduced in full, unless written approval is granted by XENCO Laboratories. This report will be filed for at least 5 years in our archives after which time it will be destroyed without further notice, unless otherwise arranged with you. The samples received, and described as recorded in Report No. 642303 will be filed for 45 days, and after that time they will be properly disposed without further notice, unless otherwise arranged with you. We reserve the right to return to you any unused samples, extracts or solutions related to them if we consider so necessary (e.g., samples identified as hazardous waste, sample sizes exceeding analytical standard practices, controlled substances under regulated protocols, etc).

We thank you for selecting XENCO Laboratories to serve your analytical needs. If you have any questions concerning this report, please feel free to contact us at any time.

Respectfully,

Ruriko Konuma

CASE NARRATIVE

Client Name: APS

Project Name: APS MGP Douglas, AZ

Project ID: D3118600.A.CS.EV.DG.0
Work Order Number(s): 642303

Report Date: 11-NOV-19
Date Received: 11/07/2019

Sample receipt non conformances and comments:

None

Sample receipt non conformances and comments per sample:

None

Analytical non conformances and comments:

Batch: LBA-3106889 PAHs by 8270D SIM

Surrogate 2-Fluorobiphenyl, Surrogate Nitrobenzene-d5 recovered below QC limits. Matrix interferences is suspected; data confirmed by re-analysis.

Samples affected are: 642303-003, 642303-005.

Batch: LBA-3106917 Metals, RCRA List, by SW 6020

Lab Sample ID 642303-004 was randomly selected for Matrix Spike/Matrix Spike Duplicate (MS/MSD).

Barium, Silver recovered below QC limits in the Matrix Spike and Matrix Spike Duplicate. Outlier/s are due to possible matrix interference. Samples in the analytical batch are: 642303-001, -002, -003, -004, -005, -006, -007, -008, -009, -010, -011, -012, -013, -014.

The Laboratory Control Sample for Silver, Barium is within laboratory Control Limits, therefore the data was accepted.

Flags

All method blanks, laboratory spikes, and/or matrix spikes met quality control objectives for the parameters associated with this Work Order except as detailed below or on the Data Qualifier page of this report. Data Qualifiers used in this report are in accordance with ADHS Data Qualifiers, Revision 4.0 9/05/2012. Data qualifiers (flags) contained within this analytical report have been issued to explain a quality control deficiency, and do not affect the quality (validity) of the data unless noted otherwise in the case narrative.

Notice: Signature of this document and relinquishment of samples constitutes a valid purchase order from client company to Xenco, its affiliates and subcontractors. It assigns standard terms and conditions of service. Xenco will be liable only for the cost of samples and shall not assume any responsibility for any losses or expenses incurred by the client if such losses are due to circumstances beyond the control of Xenco. A minimum charge of \$75.00 will be applied to each project and a charge of \$5 for each sample submitted to Xenco, but not analyzed. These terms will be enforced unless previously negotiated.

APS MGP Douglas, AZ

Project Address:

Judy Heywood:

We are reporting to you the results of the analyses performed on the samples received under the project name referenced above and identified with the XENCO Report Number(s) 642585. All results being reported under this Report Number apply to the samples analyzed and properly identified with a Laboratory ID number. Subcontracted analyses are identified in this report with either the NELAC certification number of the subcontract lab in the analyst ID field, or the complete subcontracted report attached to this report.

Unless otherwise noted in a Case Narrative, all data reported in this Analytical Report are in compliance with NELAC standards. The uncertainty of measurement associated with the results of analysis reported is available upon request. Should insufficient sample be provided to the laboratory to meet the method and NELAC Matrix Duplicate and Matrix Spike requirements, then the data will be analyzed, evaluated and reported using all other available quality control measures.

The validity and integrity of this report will remain intact as long as it is accompanied by this letter and reproduced in full, unless written approval is granted by XENCO Laboratories. This report will be filed for at least 5 years in our archives after which time it will be destroyed without further notice, unless otherwise arranged with you. The samples received, and described as recorded in Report No. 642585 will be filed for 45 days, and after that time they will be properly disposed without further notice, unless otherwise arranged with you. We reserve the right to return to you any unused samples, extracts or solutions related to them if we consider so necessary (e.g., samples identified as hazardous waste, sample sizes exceeding analytical standard practices, controlled substances under regulated protocols, etc).

We thank you for selecting XENCO Laboratories to serve your analytical needs. If you have any questions concerning this report, please feel free to contact us at any time.

Respectfully,

A handwritten signature in black ink, appearing to read 'Ruriko Konuma', is written over a horizontal line.

Analytical non conformances and comments:

Batch: LBA-3107032 Metals, RCRA List, by SW 6020

Lab Sample ID 642585-004 was randomly selected for Matrix Spike/Matrix Spike Duplicate (MS/MSD). Silver recovered below QC limits in the Matrix Spike and Matrix Spike Duplicate. Arsenic recovered above QC limits in the Matrix Spike. Barium, Chromium, Lead recovered above QC limits in the Matrix Spike and Matrix Spike Duplicate. Outlier/s are due to possible matrix interference. Samples in the analytical batch are: 642585-001, -002, -004, -005, -006, -007.

The Laboratory Control Sample for Silver, Arsenic, Chromium, Barium, Lead is within laboratory Control Limits, therefore the data was accepted.

Batch: LBA-3107033 Volatiles by SW 8260C

Iodomethane (Methyl Iodide), Propene, n-Hexane recovered below QC limits in the Blank Spike Duplicate indicating bias low results. Samples in the analytical batch are: 642585-004, -008.

Lab Sample ID 642585-004 was randomly selected for Matrix Spike/Matrix Spike Duplicate (MS/MSD). 1,1,1-Trichloroethane recovered below QC limits in the Matrix Spike. 2-Butanone, Bromomethane, Chloroethane, Cyclohexane, Iodomethane (Methyl Iodide), Propene, Trichlorofluoromethane, n-Hexane recovered below QC limits in the Matrix Spike and Matrix Spike Duplicate. Outlier/s are due to possible matrix interference. Samples in the analytical batch are: 642585-004, -008.

The Laboratory Control Sample for Bromomethane, Iodomethane (Methyl Iodide), Propene, n-Hexane, Trichlorofluoromethane, 1,1,1-Trichloroethane, 2-Butanone, Cyclohexane, Chloroethane is within laboratory Control Limits, therefore the data was accepted.

Batch: LBA-3107121 Metals, RCRA List, by SW 6020

Lab Sample ID 642585-003 was randomly selected for Matrix Spike/Matrix Spike Duplicate (MS/MSD). Barium recovered below QC limits in the Matrix Spike and Matrix Spike Duplicate. Outlier/s are due to possible matrix interference. Samples in the analytical batch are: 642585-003.

The Laboratory Control Sample for Barium is within laboratory Control Limits, therefore the data was accepted.

CASE NARRATIVE

Client Name: APS

Project Name: APS MGP Douglas, AZ

Project ID: 03118600.A.CS.EV.DG.05
Work Order Number(s): 642585

Report Date: 11.13.2019
Date Received: 11.08.2019

Batch: LBA-3107146 PAHs by 8270D SIM

Benzo(b)fluoranthene, Dibenz(a,h)Anthracene Relative Percent Difference (RPD) between matrix spike and duplicate were above quality control limits.

Samples in the analytical batch are: 642585-001, -002, -003, -004, -005, -006, -007

Surrogate Nitrobenzene-d5 recovered above QC limits Data confirmed by re-analysis. Samples affected are: 7690085-1-BSD, 642585-003 S, 642585-003 SD, 642585-007, 642585-006, 642585-005.

Lab Sample ID 642585-004 was randomly selected for Matrix Spike/Matrix Spike Duplicate (MS/MSD). Benzo(b)fluoranthene, Pyrene recovered above QC limits in the Matrix Spike Duplicate. Outlier/s are due to possible matrix interference. Samples in the analytical batch are: 642585-001, -002, -003, -004, -005, -006, -007.

The Laboratory Control Sample for Pyrene, Benzo(b)fluoranthene is within laboratory Control Limits, therefore the data was accepted.

Batch: LBA-3107194 Total Cyanide by SW 9012

Lab Sample ID 642585-004 was randomly selected for Matrix Spike/Matrix Spike Duplicate (MS/MSD). Cyanide, Total recovered below QC limits in the Matrix Spike and Matrix Spike Duplicate. Outlier/s are due to possible matrix interference. Samples in the analytical batch are: 642585-004.

The Laboratory Control Sample for Cyanide, Total is within laboratory Control Limits, therefore the data was accepted.

Flagging Criteria

Arizona Flags

All method blanks, laboratory spikes, and/or matrix spikes met quality control objectives for the parameters associated with this Work Order except as detailed below or on the Data Qualifier page of this report. Data Qualifiers used in this report are in accordance with ADHS Data Qualifiers, Revision 4.0 9/05/2012.

Data qualifiers (flags) contained within this analytical report have been issued to explain a quality control deficiency, and do not affect the quality (validity) of the data unless noted otherwise in the case narrative.

- D1** Sample required dilution due to matrix.
- D2** Sample required dilution due to high concentration of target analyte.
- M1** Matrix spike recovery was high; the associated blank spike recovery was acceptable.
- M2** Matrix spike recovery was low; the associated blank spike recovery was acceptable.
- R2** RPD/RSD exceeded the laboratory acceptance limit. See case narrative.
- R5** MS/MSD RPD exceeded the laboratory acceptance limit. Recovery met acceptance criteria.
- S10** Surrogate recovery was above laboratory and method acceptance limits. See case narrative.

Notice: Signature of this document and relinquishment of samples constitutes a valid purchase order from client company to Xenco. Its affiliates and subcontractors. It assigns standard terms and conditions of service. Xenco will be liable only for the cost of samples and shall not assume any responsibility for any losses or expenses incurred by the client if such losses are due to circumstances beyond the control of service. These terms will be enforced unless previously negotiated. Buyer's signature below constitutes acceptance of these terms.

APS MGP Douglas, AZ

Project Address:

Judy Heywood:

We are reporting to you the results of the analyses performed on the samples received under the project name referenced above and identified with the TWA Report Number(s) 642698. All results being reported under this Report Number apply to the samples analyzed and properly identified with a Laboratory ID number. Subcontracted analyses are identified in this report with either the ADHS certification number of the subcontract lab in the analyst ID field, or the complete subcontracted report attached to this report.

Unless otherwise noted in a Case Narrative, all data reported in this Analytical Report are in compliance with ADHS standards. The uncertainty of measurement associated with the results of analysis reported is available upon request. Should insufficient sample be provided to the laboratory to meet the method and ADHS Matrix Duplicate and Matrix Spike requirements, then the data will be analyzed, evaluated and reported using all other available quality control measures.

The validity and integrity of this report will remain intact as long as it is accompanied by this letter and reproduced in full, unless written approval is granted by TransWest Analytical. This report will be filed for at least 5 years in our archives after which time it will be destroyed without further notice, unless otherwise arranged with you. The samples received, and described as recorded in Report No. 642698 will be filed for 45 days, and after that time they will be properly disposed without further notice, unless otherwise arranged with you. We reserve the right to return to you any unused samples, extracts or solutions related to them if we consider so necessary (e.g., samples identified as hazardous waste, sample sizes exceeding analytical standard practices, controlled substances under regulated protocols, etc).

We thank you for selecting TransWest Analytical to serve your analytical needs. If you have any questions concerning this report, please feel free to contact us at any time.

Respectfully,

A handwritten signature in black ink, appearing to read 'Ruriko Konuma', is written over a horizontal line.

CASE NARRATIVE

Client Name: APS

Project Name: APS MGP Douglas, AZ

Project ID:

Work Order Number(s): 642698

Report Date: 11.13.2019

Date Received: 11.08.2019

Sample receipt non conformances and comments:

None

Sample receipt non conformances and comments per sample:

None

Analytical non conformances and comments:

Batch: LBA-3107053 VOCs by SW-846 8260C

Lab Sample ID 642698-001 was randomly selected for Matrix Spike/Matrix Spike Duplicate (MS/MSD). Acetone recovered below QC limits in the Matrix Spike. Outlier/s are due to possible matrix interference. Samples in the analytical batch are: 642698-001, -002, -003, -004, -005.

The Laboratory Control Sample for Acetone is within laboratory Control Limits, therefore the data was accepted.

Flagging Criteria

Arizona Flags

All method blanks, laboratory spikes, and/or matrix spikes met quality control objectives for the parameters associated with this Work Order except as detailed below or on the Data Qualifier page of this report. Data Qualifiers used in this report are in accordance with ADHS Data Qualifiers, Revision 4.0 9/05/2012.

Data qualifiers (flags) contained within this analytical report have been issued to explain a quality control deficiency, and do not affect the quality (validity) of the data unless noted otherwise in the case narrative.

M2 Matrix spike recovery was low; the associated blank spike recovery was acceptable.

Notice: Signature of this document and relinquishment of samples constitutes a valid purchase order from client company to Xenco, its affiliates and subcontractors. It assigns standard terms and conditions of service. Xenco will be liable only for the cost of samples and shall not assume any responsibility for any losses or expenses incurred by the client if such losses are due to circumstances beyond the control of Xenco. A minimum charge of \$75.00 will be applied to each project and a charge of \$5 for each sample submitted to Xenco, but not analyzed. These terms will be enforced unless previously negotiated.

Reference: TWA Report No(s): **642702**

APS MGP Douglas, AZ

Project Address:

Judy Heywood:

We are reporting to you the results of the analyses performed on the samples received under the project name referenced above and identified with the TWA Report Number(s) 642702. All results being reported under this Report Number apply to the samples analyzed and properly identified with a Laboratory ID number. Subcontracted analyses are identified in this report with either the ADHS certification number of the subcontract lab in the analyst ID field, or the complete subcontracted report attached to this report.

Unless otherwise noted in a Case Narrative, all data reported in this Analytical Report are in compliance with ADHS standards. The uncertainty of measurement associated with the results of analysis reported is available upon request. Should insufficient sample be provided to the laboratory to meet the method and ADHS Matrix Duplicate and Matrix Spike requirements, then the data will be analyzed, evaluated and reported using all other available quality control measures.

The validity and integrity of this report will remain intact as long as it is accompanied by this letter and reproduced in full, unless written approval is granted by TransWest Analytical. This report will be filed for at least 5 years in our archives after which time it will be destroyed without further notice, unless otherwise arranged with you. The samples received, and described as recorded in Report No. 642702 will be filed for 45 days, and after that time they will be properly disposed without further notice, unless otherwise arranged with you. We reserve the right to return to you any unused samples, extracts or solutions related to them if we consider so necessary (e.g., samples identified as hazardous waste, sample sizes exceeding analytical standard practices, controlled substances under regulated protocols, etc).

We thank you for selecting TransWest Analytical to serve your analytical needs. If you have any questions concerning this report, please feel free to contact us at any time.

Respectfully,

A handwritten signature in black ink, appearing to read 'Ruriko Konuma', is written over a horizontal line.

CASE NARRATIVE

Client Name: APS

Project Name: APS MGP Douglas, AZ

Project ID: D3118600.A.CS.EV.DG.0.
Work Order Number(s): 642702

Report Date: 11.18.2019
Date Received: 11.08.2019

Sample receipt non conformances and comments:

None

Sample receipt non conformances and comments per sample:

None

Flagging Criteria

Arizona Flags

All method blanks, laboratory spikes, and/or matrix spikes met quality control objectives for the parameters associated with this Work Order except as detailed below or on the Data Qualifier page of this report. Data Qualifiers used in this report are in accordance with ADHS Data Qualifiers, Revision 4.0 9/05/2012.

Data qualifiers (flags) contained within this analytical report have been issued to explain a quality control deficiency, and do not affect the quality (validity) of the data unless noted otherwise in the case narrative.

- H5** This test is specified to be performed in the field within 15 minutes of sampling; Sample was received and analyzed past the regulatory holding time.
- M2** Matrix spike recovery was low; the associated blank spike recovery was acceptable.

Notice: Signature of this document and relinquishment of samples constitutes a valid purchase order from client company to Xenco, its affiliates and subcontractors. It assigns standard terms and conditions of service. Xenco will be liable only for the cost of samples and shall not assume any responsibility for any losses or expenses incurred by the client if such losses are due to circumstances beyond the control of Xenco. A minimum charge of \$75.00 will be applied to each project and a charge of \$5 for each sample submitted to Xenco, but not analyzed. These terms will be enforced unless previously negotiated.

Reference: TWA Report No(s): **642703**

APS MGP Douglas, AZ

Project Address:

Judy Heywood:

We are reporting to you the results of the analyses performed on the samples received under the project name referenced above and identified with the TWA Report Number(s) 642703. All results being reported under this Report Number apply to the samples analyzed and properly identified with a Laboratory ID number. Subcontracted analyses are identified in this report with either the ADHS certification number of the subcontract lab in the analyst ID field, or the complete subcontracted report attached to this report.

Unless otherwise noted in a Case Narrative, all data reported in this Analytical Report are in compliance with ADHS standards. The uncertainty of measurement associated with the results of analysis reported is available upon request. Should insufficient sample be provided to the laboratory to meet the method and ADHS Matrix Duplicate and Matrix Spike requirements, then the data will be analyzed, evaluated and reported using all other available quality control measures.

The validity and integrity of this report will remain intact as long as it is accompanied by this letter and reproduced in full, unless written approval is granted by TransWest Analytical. This report will be filed for at least 5 years in our archives after which time it will be destroyed without further notice, unless otherwise arranged with you. The samples received, and described as recorded in Report No. 642703 will be filed for 45 days, and after that time they will be properly disposed without further notice, unless otherwise arranged with you. We reserve the right to return to you any unused samples, extracts or solutions related to them if we consider so necessary (e.g., samples identified as hazardous waste, sample sizes exceeding analytical standard practices, controlled substances under regulated protocols, etc).

We thank you for selecting TransWest Analytical to serve your analytical needs. If you have any questions concerning this report, please feel free to contact us at any time.

Respectfully,

A handwritten signature in black ink, appearing to read 'Ruriko Konuma', is written over a horizontal line.

CASE NARRATIVE

Client Name: APS

Project Name: APS MGP Douglas, AZ

Project ID: *D3118600.A.CS.EV.DG.0.*
Work Order Number(s): *642703*

Report Date: *11.19.2019*
Date Received: *11.08.2019*

Sample receipt non conformances and comments:

None

Sample receipt non conformances and comments per sample:

None

Analytical non conformances and comments:

Batch: LBA-3107624 PCBs by SW-846 8082A

642703-001 analyzed at a dilution due to physical characteristics.

Flagging Criteria

Arizona Flags

All method blanks, laboratory spikes, and/or matrix spikes met quality control objectives for the parameters associated with this Work Order except as detailed below or on the Data Qualifier page of this report. Data Qualifiers used in this report are in accordance with ADHS Data Qualifiers, Revision 4.0 9/05/2012.

Data qualifiers (flags) contained within this analytical report have been issued to explain a quality control deficiency, and do not affect the quality (validity) of the data unless noted otherwise in the case narrative.

- D1** Sample required dilution due to matrix.
- D2** Sample required dilution due to high concentration of target analyte.
- M1** Matrix spike recovery was high; the associated blank spike recovery was acceptable.
- M2** Matrix spike recovery was low; the associated blank spike recovery was acceptable.

Notice: Signature of this document and relinquishment of samples constitutes a valid purchase order from client company to Xenco, its affiliates and subcontractors. It assigns standard terms and conditions of service. Xenco will be liable only for the cost of samples and shall not assume any responsibility for any losses or expenses incurred by the client if such losses are due to circumstances beyond the control of Xenco. A minimum charge of \$75.00 will be applied to each project and a charge of \$75.00 for each sample submitted to Xenco, but not analyzed. These terms will be enforced unless previously negotiated.

Pre-design Testing Investigation Data Evaluation

Arizona Public Service Former Manufactured Gas Plant, Douglas Site Soil and Groundwater Sampling 2019 Data Quality Evaluation Report

Introduction

The objective of this data quality evaluation (DQE) report is to assess the data quality of analytical results for soil and groundwater samples collected at the Arizona Public Service Former Manufactured Gas Plant, Douglas Site as part of a site investigation. Individual method requirements and guidelines from the Arizona Public Service Quality Assurance Project Plan (QAPP) (Jacobs, 2019) were used in this assessment.

This report is intended as a general data quality assessment designed to summarize data issues.

Analytical Data

This DQE report covers 168 normal soil samples, 4 normal groundwater samples, 20 soil field duplicates (FD), one groundwater FD, 2 equipment blanks (EB), and 6 trip blanks (TB). Samples were collected between October 27 and November 7, 2019. A list of sample identifications and collection dates is included in Attachment A at the end of this report.

The analyses were performed by Xenco Laboratories in Tempe, AZ. Samples were collected and delivered by courier to the laboratory for analysis. The sample results were reported in seven sample delivery groups (SDGs): 641446, 641801, 641882, 642000, 642303, 642585, and 642698.

Selected samples were analyzed for one or more of the following analytes and methods presented in Table 1.

Table 1. Analytical Parameters

| Method | Parameter |
|---------------------|-----------------------------------|
| SW6010C | TCLP Metals |
| SW6020/E200.8 | Metals |
| SW7470A/SW7471B | Mercury and TCLP Mercury |
| SW8082 | Polychlorinated biphenyls |
| SW8260C | Volatile organic compounds |
| SW8270D/SW8270D-SIM | Polynuclear aromatic hydrocarbons |
| SW1010 | Ignitability |
| SW9012 | Cyanide |
| SW9045D | pH |
| SW9095 | Free liquids |

The assessment of data includes a review of: (1) the chain-of-custody (CoC) documentation; (2) holding-time compliance; (3) the required field and laboratory quality control (QC) samples; (4) method blanks;

(5) laboratory control samples and laboratory control sample duplicates (LCS/LCSDs); (6) surrogate spike recoveries for organic analyses; and, (7) matrix spikes and matrix spike duplicate samples (MS/MSDs).

Field samples were also reviewed to ascertain field compliance and data quality issues. This included a review of FDs, EBs, and TBs.

Data flags are assigned according to the QAPP. These flags, as well as the reason for each flag, are entered into an electronic database. Multiple flags are routinely applied to specific sample method, matrix, and analyte combinations, but there will be only one final flag. A final flag is applied to the data and is the most conservative of the applied validation flags. The final flag also includes blank sample impacts.

The data flags are defined as follows:

- J = Analyte was present, but the reported value may not be accurate or precise (estimated). The result was estimated due to either being less than the referenced reporting limit but greater than the method detection limit or due to a QC exceedance.
- R = The result was unusable due to deficiencies in the ability to analyze the sample and meet QC criteria.
- U = Analyte was not detected at the specified detection limit.
- UJ = Analyte was not detected, and the specified detection limit may not be accurate or precise (estimated).

Findings

The overall summaries of the data validation findings are contained in the following sections and summarized in Attachment B at the end of this DOE report.

Holding Times

All holding-time criteria were met.

Calibration

Initial and continuing calibration data were not supplied in the data packages and were not part of the routine validation performed. The laboratory did not report any criteria exceedances in the case narratives.

Method Blanks

Method blanks were analyzed at the required frequency and were free of contamination that would affect the sample results.

Field Blanks

Two EBs and six TBs were collected at the required frequency and were free of contamination that would affect the sample results.

Matrix Spike Samples

The results of MS/MSD analyses provide information about the possible influence of the matrix on either accuracy or precision of the measurements. MS/MSD recoveries and the associated RPDs met criteria with the following exceptions:

- The recoveries of arsenic, barium, chromium and lead were greater than the upper control limits in the MSs and /or MSDs of six soil samples for Method SW6020, indicating the associated

parent sample results are possibly biased high. Eleven associated detected results were qualified as estimated and flagged "J".

- The recoveries of lead and silver were less than the lower control limit in the MSs and MSDs of three soil samples for Method SW6020, indicating the associated parent sample results are possibly biased low. Two associated nondetected results were qualified as estimated and flagged "UJ"; one associated detected result was qualified as estimated and flagged "J".
- The recovery of cyanide was less than the lower control limit in the MSs and MSDs of two soil samples for Method SW9012, indicating the associated parent sample results are possibly biased low. One associated nondetected result was qualified as estimated and flagged "UJ"; one associated detected result was qualified as estimated and flagged "J".
- The recovery of acetone was less than the lower control limit in the MS of one groundwater sample for Method SW8260C, indicating the associated parent sample result is possibly biased low. One associated nondetected result was qualified as estimated and flagged "UJ".
- The recoveries of 2-butanone, bromomethane, chloroethane, bromoform, 1,1,1-trichloroethane, acetone, cyclohexane, iodomethane, n-hexane, propene and trichlorofluoromethane were less than the lower control limits in the MSs and/or MSDs of three soil samples for Method SW8260C, indicating the associated parent sample results are possibly biased low. Sixteen associated nondetected results were qualified as estimated and flagged "UJ".
- The recoveries of benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, chrysene, fluoranthene, indeno(1,2,3-c,d)pyrene, phenanthrene and pyrene were less than the lower control limits in the MSs and/or MSDs of two soil samples for Method SW8270D-SIM, indicating the associated parent sample results are possibly biased low. Seventeen associated detected results were qualified as estimated and flagged "J".
- The recoveries of benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, chrysene, fluoranthene, indeno(1,2,3-c,d)pyrene, phenanthrene and pyrene were greater than the upper control limits in the MSs and/or MSDs of six soil samples for Method SW8270D-SIM, indicating the associated parent sample results are possibly biased high. Twenty-three associated detected results were qualified as estimated and flagged "J".
- The relative percent differences (RPD) of acenaphthylene, anthracene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, chrysene, fluoranthene, indeno(1,2,3-c,d)pyrene, phenanthrene and pyrene were greater than the control limit in the MS/MSD sets of four soil samples for Method SW8270D-SIM, indicating associated sample results are possibly biased. Nineteen associated detected results were qualified as estimated and flagged "J".

Field Duplicates

Twenty-one FD sets were collected and analyzed with this event. A list of the FD and associated parent sample identifications (IDs) is included in Table 2.

Table 2. List of Field Duplicates

| Associated Parent Sample ID | Field Duplicate Sample ID |
|-----------------------------|---------------------------|
| D-B12-5.0-5.5 | D-FD02-103119 |
| D-B13-15.0-15.5 | D-FD01-103119 |
| D-B15-10.0-10.5 | D-FD04-110119 |

Table 2. List of Field Duplicates

| Associated Parent Sample ID | Field Duplicate Sample ID |
|-----------------------------|---------------------------|
| D-B15-5.0-5.5 | D-FD03-110119 |
| D-B16-15.0-15.5 | D-FD02-102919 |
| D-B16-2.5-3.0 | D-FD01-102919 |
| D-B18-5.0-5.5 | D-FD03-102819 |
| D-B20-0-102719 | D-FD01-102719 |
| D-B21-2.5-3.0 | D-FD02-110119 |
| D-B23-25-3.0 | D-FD03-103119 |
| D-B24-19.5-20.0 | D-FD01-103019 |
| D-B25-40.0-40.5 | D-FD04-103119 |
| D-B26-2.5-3.0 | D-FD05-110119 |
| D-B27-2.5-3.0 | D-FD01-110319 |
| D-B27-25.0-25.5 | D-FD02-110319 |
| D-B27-30.0-30.5 | D-FD01-110219 |
| D-B28-5.0-5.5 | D-FD03-102919 |
| D-B30-5.0-5.5 | D-FD01-110119 |
| D-B32-5.0-5.5 | B-FD02-102819 |
| D-B34-0-102719 | D-FD01-102819 |
| D-MW27 | D-FD01-110719 |

All precision criteria were met with the following exceptions:

- The RPDs of 15 analytes were greater than the acceptance criterion in FD set D-B12-5.0-5.5/D-FD02-103119 for Method SW8270D-SIM. Twenty-seven detected results were qualified as estimated and flagged "J"; three nondetected results were qualified as estimated and flagged "UJ".
- The RPDs of 13 analytes were greater than the acceptance criterion in FD set D-B13-15.0-15.5/D-FD01-103119 for Method SW8270D-SIM. Twenty-six detected results were qualified as estimated and flagged "J".
- The RPDs of 13 analytes were greater than the acceptance criterion in FD set D-B16-15.0-15.5/D-FD02-102919 for Method SW8270D-SIM. Twenty-five detected results were qualified as estimated and flagged "J"; one nondetected result was qualified as estimated and flagged "UJ".
- The RPDs of two analytes were greater than the acceptance criterion in FD set D-B23-25-3.0/D-FD03-103119 for Method SW8270D-SIM. Four detected results were qualified as estimated and flagged "J".
- The RPDs of 15 analytes were greater than the acceptance criterion in FD set D-B24-19.5-20.0/D-FD01-103019 for Method SW8270D-SIM. Twenty-seven detected results were qualified as estimated and flagged "J"; three nondetected results were qualified as estimated and flagged "UJ".

- The RPD of barium was greater than the acceptance criterion in FD set D-B27-2.5-3.0/D-FD01-110319 for Method SW6020. Two detected results were qualified as estimated and flagged "J".
- The RPDs of 10 analytes were greater than the acceptance criterion in FD set D-B28-5.0-5.5/D-FD03-102919 for Method SW8270D-SIM. Nineteen detected results were qualified as estimated and flagged "J"; one nondetected result was qualified as estimated and flagged "UJ".
- The RPDs of 10 analytes were greater than the acceptance criterion in FD set D-B32-5.0-5.5/B-FD02-102819 for Method SW8270D-SIM. Twenty detected results were qualified as estimated and flagged "J".
- The RPDs of 10 analytes were greater than the acceptance criterion in FD set D-B34-0-102719/D-FD01-102819 for Method SW8270D-SIM. Sixteen detected results were qualified as estimated and flagged "J"; four nondetected results were qualified as estimated and flagged "UJ".
- The RPDs of 11 analytes were greater than the acceptance criterion in FD set D-B18-5.0-5.5/D-FD03-102819 for Method SW8270D-SIM. Twenty-two detected results were qualified as estimated and flagged "J".
- The RPDs of two analytes were greater than the acceptance criterion in FD set D-B16-2.5-3.0/D-FD01-102919 for Method SW8270D-SIM. Three detected results were qualified as estimated and flagged "J"; one nondetected result was qualified as estimated and flagged "UJ".
- The RPD of lead was greater than the acceptance criterion in FD set D-B30-5.0-5.5/D-FD01-110119 for Method SW6020. Two detected results were qualified as estimated and flagged "J".
- The RPD of chromium was greater than the acceptance criterion in FD set D-B32-5.0-5.5/B-FD02-102819 for Method SW6020. Two detected results were qualified as estimated and flagged "J".
- The RPDs of arsenic, lead and chromium were greater than the acceptance criterion in FD set D-B18-5.0-5.5/D-FD03-102819 for Method SW6020. Six detected results were qualified as estimated and flagged "J".
- The RPDs of barium and lead were greater than the acceptance criterion in FD set D-B34-0-102719/D-FD01-102819 for Method SW6020. Four detected results were qualified as estimated and flagged "J".
- The RPD of naphthalene was greater than the acceptance criterion in FD set D-B20-0-102719/ D-FD01-102719 for Method SW8270D-SIM. One detected result was qualified as estimated and flagged "J"; one nondetected result was qualified as estimated and flagged "UJ".
- The RPD of mercury was greater than the acceptance criterion in FD sets D-B30-5.0-5.5/D-FD01-110119, D-B18-5.0-5.5 D-FD03-102819, D-B34-0-102719/ D-FD01-102819 and D-B32-5.0-5.5/B-FD02-102819 for Method SW7471B. Four detected results were qualified as estimated and flagged "J"; four nondetected results were qualified as estimated and flagged "UJ".

Surrogates

Surrogate spikes were analyzed in each sample as required. All acceptance criteria were met with the following exception:

- Surrogate recovery was greater than the upper control limit in soil samples D-B12-7.5-8.0, D-B13-1.0-1.5, D-B29-10.0-10.5, D-B29-15.0-15.5, D-B34-5.0-5.5-102819 and D-B29-20.0-20.5 for Method SW8270D-SIM, indicating associated sample results are possibly biased high. Sixty-six associated detected results were qualified as estimated and flagged "J".

Internal Standards

Internal standard data were not supplied in the data packages and were not part of the routine validation performed. The laboratory did not report any criteria exceedances in the case narratives.

Laboratory Control Samples

LCS/LCSDs were analyzed for all methods as required and all accuracy and precision criteria were met with the following exceptions:

- The recoveries of iodomethane, n-hexane and propene were less than criteria in a LCS for Method SW8260C, indicating associated sample results are possibly biased low. Three associated nondetected results were qualified as estimated and flagged "UJ".
- The recovery of mercury was less than criteria in a LCS for Method SW7471B, indicating associated sample results are possibly biased low. Ten associated nondetected results were qualified as estimated and flagged "UJ"; one associated detected result was qualified as estimated and flagged "J".

Miscellaneous

The cyclohexane results in the groundwater samples were noted by the laboratory as having interference. The four associated nondetected results were qualified as estimated and flagged "UJ".

Chain of Custody and Sample Receipt

Each sample was documented in a completed CoC form. All samples were received at the laboratory within temperature criteria and properly preserved.

Overall Assessment

The final activity in the DQE is an assessment of whether the data meet the data quality objectives (DQOs). The goal of this assessment is to demonstrate that a sufficient number of representative samples was collected and the resulting analytical data can be used to support the decision-making process. The following summary highlights the data evaluation findings for the events defined herein:

1. The precision and accuracy of the data, as measured by laboratory QC indicators, suggest that the QAPP goals have been met.
2. No data were rejected. Completeness was 100 percent for all method/matrix/analyte combinations.
3. No data were qualified due to associated laboratory, EB or TB contamination.
4. Approximately 5 percent of the data were qualified due to QC exceedances. These exceedances include the following: FD RPD exceedances, LCS recovery exceedances, MS/MSD recovery and RPD exceedances, surrogate recovery exceedances, and matrix interference.
5. The field crews and laboratory followed QAPP and project documents, thereby assuring representativeness and comparability with previous studies.

Samples Associated with Data Quality Evaluation

| Sample ID | Sample Date | Sample Purpose | Matrix |

Notes:

FD>RPD = Field duplicate relative percent difference criterion exceeded

LCS<LCL = Laboratory control sample recovery less than the lower control limit

MISC = Laboratory flagged for matrix interference

MS<LCL = Matrix spike recovery less than the lower control limit

MS>UCL = Matrix spike recovery greater than the upper control limit

MSRPD = Matrix spike duplicate relative percent difference criterion exceeded

SD<LCL = Matrix spike duplicate recovery less than the lower control limit

SD>UCL = Matrix spike duplicate recovery greater than the upper control limit

Sur>UCL = Surrogate recovery greater than the upper control limit

Appendix I

Manifests and Bills of Lading

Manifests will be provided when available.

Notes:

[1] For chemicals without published Regional Screening Levels, surrogate values were selected as indicated below:

RSLs for acenaphthene was used for acenaphthylene, pyrene for benzo(g,h,i)perylene, anthracene for phenanthrene, m- Xylene for m,p-xylenes, hexavalent chromium for total chromium.

[2] Benzo(a)pyrene was evaluated both as a carcinogen using a BAP TEQ concentration and as a noncarcinogen using benzo(a)pyrene concentration.

[3] Benzo(a)anthracene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenz(a,h)anthracene, and indeno(1,23-c,d)pyrene were evaluated as a carcinogen using a BAP TEQ concentration for risk calculations

[4] Lead is evaluated by comparing EPC with RSL only.

-- = not applicable because of no RSL available

(ND = 0) = Indicates that for nondetects the value used in the BAP TEQ calculation was zero.

(ND = 1/2*RL) = Indicates that for nondetects the value used in the BAP TEQ calculation was half the reporting limit

bgs = below ground surface

C = RSL based on cancer effects

COPC = chemical of potential concern

N = RSL based on noncancer effects

NA = not available or not applicable

NC = not calculated (maximum detected concentration does not exceed RSL)

ND = nondetect

BAP TEQ = benzo(a)pyrene toxicity equivalent

RL = reporting limit

RSL = EPA Regional Screening Level for Residential and industrial soil (Accessed 12/02/2019). Cancer-based RSLs were adjusted to a target risk of 1E-05 per agreement with the Arizona Department of Environmental Quality.

THQ = target hazard quotient

TR = target risk

UCL = upper confidence limit

Notes:

[1] For chemicals without published Regional Screening Levels, surrogate values were selected as indicated below:

RSLs for acenaphthene was used for acenaphthylene, pyrene for benzo(g,h,i)perylene, and anthracene for phenanthrene, hexavalent chromium for total chromium.

[2] Benzo(a)pyrene was evaluated both as a carcinogen using a BAP TEQ concentration and as a noncarcinogen using benzo(a)pyrene concentration.

[3] Benzo(a)anthracene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenz(a,h)anthracene, and indeno(1,23-c,d)pyrene were evaluated as a carcinogen using a BAP TEQ concentration for risk calculations

[4] Lead is evaluated by comparing EPC with RSL only.

-- = not applicable because of no RSL exceedance (i.e., no COPC identified)

(ND = 0) Indicates that for nondetects the value used in the BAP TEQ calculation was zero.

(ND = 1/2*RL) = Indicates that for nondetects the value used in the BAP TEQ calculation was half the reporting limit

bgs = below ground surface

C = RSL based on cancer effects

COPC = chemical of potential concern

N = RSL based on noncancer effects

NC = not calculated (maximum detected concentration does not exceed RSL)

ND = nondetect

BAP TEQ = benzo(a)pyrene toxicity equivalent

RL = reporting limit

RSL = EPA Regional Screening Level for Residential and industrial soil (Accessed 12/02/2019). Cancer-based RSLs were adjusted to a target risk of 1E-05 per agreement with the Arizona Department of Environmental Quality.

THQ = target hazard quotient

TR = target risk

UCL = upper confidence limit

Notes:

[1] For chemicals without published Regional Screening Levels, surrogate values were selected as indicated below:

RSLs for acenaphthene was used for acenaphthylene, pyrene for benzo(g,h,i)perylene, anthracene for phenanthrene, m- Xylene for m,p-xylenes, hexavalent chromium for total chromium.

[2] Benzo(a)pyrene was evaluated both as a carcinogen using a BAP TEQ concentration and as a noncarcinogen using benzo(a)pyrene concentration.

[3] Benzo(a)anthracene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenz(a,h)anthracene, and indeno(1,23-c,d)pyrene were evaluated as a carcinogen using a BAP TEQ concentration for risk calculations

[4] Lead is evaluated by comparing EPC with RSL only.

-- = not applicable because of no RSL available

(ND = 0) = Indicates that for nondetects the value used in the BAP TEQ calculation was zero.

(ND = 1/2*RL) = Indicates that for nondetects the value used in the BAP TEQ calculation was half the reporting limit

bgs = below ground surface

C = RSL based on cancer effects

COPC = chemical of potential concern

ELCR = excess lifetime cancer risk

EPC = exposure point concentration

HI = hazard index

N = RSL based on noncancer effects

NA = not available or not applicable

NC = not calculated

ND = nondetect

BAP TEQ = benzo(a)pyrene toxicity equivalent

RL = reporting limit

RSL = EPA Regional Screening Level for Residential and industrial soil (Accessed 12/02/2019). Cancer-based RSLs were adjusted to a target risk of 1E-05 per agreement with the Arizona Department of Environmental Quality.

THQ = target hazard quotient

TR = target risk

UCL = upper confidence limit

| | | | | |
|---------------------------------------|-------|---|-------|-----|

Notes:

[1] For chemicals without published Regional Screening Levels, surrogate values were selected as indicated below:

RSLs for acenaphthene was used for acenaphthylene, pyrene for benzo(g,h,i)perylene, and anthracene for phenanthrene, hexavalent chromium for total chromium.

[2] Benzo(a)pyrene was evaluated both as a carcinogen using a BAP TEQ concentration and as a noncarcinogen using benzo(a)pyrene concentration.

[3] Benzo(a)anthracene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenz(a,h)anthracene, and indeno(1,23-c,d)pyrene were evaluated as a carcinogen using a BAP TEQ concentration for risk calculations

[4] Lead is evaluated by comparing EPC with RSL only.

-- = not applicable because of no RSL exceedance (i.e., no COPC identified)

(ND = 0) Indicates that for nondetects the value used in the BAP TEQ calculation was zero.

(ND = 1/2*RL) = Indicates that for nondetects the value used in the BAP TEQ calculation was half the reporting limit

bgs = below ground surface

C = RSL based on cancer effects

COPC = chemical of potential concern

ELCR = excess lifetime cancer risk

HI = hazard index

N = RSL based on noncancer effects

NC = not calculated

ND = nondetect

BAP TEQ = benzo(a)pyrene toxicity equivalent

RL = reporting limit

RSL = EPA Regional Screening Level for Residential and industrial soil (Accessed 12/02/2019). Cancer-based RSLs were adjusted to a target risk of 1E-05 per agreement with the Arizona Department of Environmental Quality.

THQ = target hazard quotient

TR = target risk

UCL = upper confidence limit

| | | | |
|-------|-----|-------|------|
| 1E-04 | 0.7 | 1E-05 | 0.05 |
|-------|-----|-------|------|

Total Risk/HI (BAP TEQ, ND = 0):

| | | | |
|-------|-----|-------|------|
| 1E-04 | 0.7 | 1E-05 | 0.05 |
|-------|-----|-------|------|

[1] For chemicals without published Regional Screening Levels, surrogate values were selected as indicated below:

RSLs for acenapthene was used for acenaphthylene, pyrene for benzo(g,h,i)perylene, and anthracene for phenanthrene, hexavalent chromium for total chromium.

[2] Benzo(a)pyrene was evaluated both as a carcinogen using a BAP TEQ concentration and as a noncarcinogen using benzo(a)pyrene concentration.

[3] Benzo(a)anthracene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenz(a,h)anthracene, and indeno(1,23-c,d)pyrene were evaluated as a carcinogen using a BAP TEQ concentration for risk calculations

[4] Lead is evaluated by comparing EPC with RSL only.

-- = not applicable because of no RSL exceedance (i.e., no COPC identified)

(ND = 0) Indicates that for nondetects the value used in the BAP TEQ calculation was zero.

(ND = 1/2*RL) = Indicates that for nondetects the value used in the BAP TEQ calculation was half the reporting limit

bgs = below ground surface

C = RSL based on cancer effects

COPC = chemical of potential concern

ELCR = excess lifetime cancer risk

HI = hazard index

N = RSL based on noncancer effects

NC = not calculated

ND = nondetect

BAP TEQ = benzo(a)pyrene toxicity equivalent

RL = reporting limit

RSL = EPA Regional Screening Level for Residential and industrial soil (Accessed 12/02/2019). Cancer-based RSLs were adjusted to a target risk of 1E-05 per agreement with the Arizona Department of Environmental Quality.

THQ = target hazard quotient

TR = target risk

UCL = upper confidence limit

Notes:

Total ELCR:3E-07

HI:0.03

-- = not applicable because of no RSL available

ELCR = excess lifetime cancer risk

HI = hazard index

HQ = hazard quotient

Maximum = maximum detected concentration

NC = not calculated

RSL = EPA Regional Screening Level for Tap Water (Accessed 11/27/2019). Cancer-based RSLs were adjusted to a target risk of 1E-05 per agreement with the Arizona Department of Environmental Quality.

THQ = target hazard quotient (noncancer)

TR = target risk

UCL = upper confidence limit

Table K-12
Risk Summary
Human Health Risk Assessment, Former Manufactured Gas Plant Site, Douglas, Arizona

| Exposure Scenario | Area | Exposure Medium | Total ELCR ¹ | Primary Contributors ² | Total ELCR for Site-Related COPCs ³ | Site-related Primary Contributor ³ | Hazard Index | Primary Contributors ² |
|-------------------|----------------------|---|-------------------------|---|--|--|--------------|-----------------------------------|
| Industrial | Onsite | Surface and Subsurface Soil (0-15 feet bgs) | 2E-05 | arsenic, chromium, BAP TEQ, naphthalene | 1E-05 | arsenic (5-10 bgs only), BAP TEQ, naphthalene | 0.2 | none |
| | | Deep Soil (>15 feet bgs) | 1E-05 | arsenic, chromium | 5E-07 | none | 0.07 | none |
| | Background (Offsite) | Surface and Subsurface Soil (0-15 feet bgs) | 7E-06 | arsenic, chromium | N/A | N/A | 0.05 | none |
| | | Deep Soil (>15 feet bgs) | 1E-05 | arsenic, chromium | N/A | N/A | 0.05 | none |
| Residential | Onsite | Surface and Subsurface Soil (0-15 feet bgs) | 2E-04 | arsenic, chromium, BAP TEQ, naphthalene | 2E-04 | arsenic (5-10 ft bgs only), BAP TEQ, naphthalene | 2 | none |
| | | Deep Soil (>15 feet bgs) | 1E-04 | arsenic, chromium, BAP TEQ | 9E-06 | none | 0.9 | none |
| | Background (Offsite) | Surface and Subsurface Soil (0-15 feet bgs) | 7E-05 | arsenic, chromium, BAP TEQ | N/A | N/A | 0.7 | none |
| | | Deep Soil (>15 feet bgs) | 1E-04 | arsenic, chromium, BAP TEQ | N/A | N/A | 0.7 | none |
| | N/A | Groundwater | 3E-07 | none | N/A | none | 0.03 | none |

Notes:

1. ELCR with BAP TEQ, ND = 1/2*RL is presented.
2. Primary contributors are identified if individual COPC ELCR > 1E-06 or HQ > 1.
3. Based on background risk estimates and statistical comparsion (Section 4), arsenic is not considered site related in 0 to 5 feet bgs and in deep (> 15 feet bgs) soil. For chromium, risks were calculated using hexavalent chromium. Based on background risk estimates, chromium is not considered site related in surface and subsurface soil, and deep soil.

BAP TEQ = benzo(a)pyrene toxicity equivalent concentration
bgs = below ground surface
COPC = chemical of potential concern
ELCR = excess lifetime cancer risk
HQ = hazard quotient
RL = Reporting limit

Table K-13
Chemicals of Concern
Human Health Risk Assessment, Former Manufactured Gas Plant Site, Douglas, Arizona

| Exposure Scenario | Area | Exposure Medium | Chemical of Concern | Basis ¹ |
|-------------------|--------|---|-------------------------------|---|
| Industrial | Onsite | Surface and Subsurface Soil (0-15 feet bgs) | arsenic, BAP TEQ, naphthalene | Arsenic (5-10 ft bgs), BAP TEQ and naphthalene for cancer risk (ELCR). |
| | | Deep Soil (>15 feet bgs) | none | Total cancer risk estimate (ELCR)/non-cancer hazard estimate (HI) less than 1E-05/1 |
| Residential | Onsite | Surface and Subsurface Soil (0-15 feet bgs) | arsenic, BAP TEQ, naphthalene | Arsenic (5-10 ft bgs), BAP TEQ and naphthalene for cancer risk (ELCR). |
| | | Deep Soil (>15 feet bgs) | none | Total cancer risk estimate (ELCR)/non-cancer hazard estimate (HI) less than 1E-05/1 |
| | N/A | Groundwater | none | Total cancer risk estimate (ELCR)/non-cancer hazard estimate (HI) less than 1E-05/1 |

Notes:

1. COCs identified if total ELCR > 1E-05 or HI > 1 and individual chemical ELCR > 1E_06 or HQ > 1.

BAP TEQ = benzo(a)pyrene toxicity equivalent concentration

bgs = below ground surface

COC = chemical concern

ELCR = excess lifetime cancer risk

HQ = hazard quotient

Notes:

BaP TEQ = Benzo(a)pyrene toxicity equivalent

U = nondetect

UJ = nondetect estimated

J = detect estimated concentration

RL = reporting limit

RPF = relative potency factor

| 131 | | | | | | | | | | | | |
| 132 | Gamma ROS Statistics using Imputed Non-Detects | | | | | | | | | | | |
| 133 | GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs | | | | | | | | | | | |
| 134 | GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20) | | | | | | | | | | | |
| 135 | For such situations, GROS method may yield incorrect values of UCLs and BTVs | | | | | | | | | | | |
| 136 | This is especially true when the sample size is small. | | | | | | | | | | | |
| 137 | For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates | | | | | | | | | | | |
| 138 | Minimum | | | | 0.00177 | Mean | | | | | | 0.871 |

| 788 | These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006). | | | | | | | | | | | |
| 789 | However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician. | | | | | | | | | | | |
| 790 | | | | | | | | | | | | |
| 791 | ProUCL computes and outputs H-statistic based UCLs for historical reasons only. | | | | | | | | | | | |
| 792 | H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide. | | | | | | | | | | | |
| 793 | It is therefore recommended to avoid the use of H-statistic based 95% UCLs. | | | | | | | | | | | |
| 794 | Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution. | | | | | | | | | | | |

Notes:

Cells highlighted in yellow indicate that the compound exceeded the Residential Soil Remediation Level only.

Cells highlighted in red indicate that the compound exceeded the Non-residential Soil Remediation Level only.

J = Analyte is present but the reported value might not be accurate or precise (estimate).

U = Analyte was not detected at the specified detection limit.

UJ = Analyte was not detected at the specified detection limit, detection limit is estimated.

ft bgs = foot (feet) below ground surface

ID = identification number

mg/kg = milligram(s) per kilogram

* = Locations added to waste characterization results

Appendix L

Groundwater Protection Level Modeling

1/1/2013

Model Inputs

Select chemical name from drop down list
Ct = Initial total soil contamination, ug/kg (ug/kg = (ug/l)/Pb)
Kh (dimensionless)
S (water solubility, mg/l)
Koc (L/Kg)
T1/2 (d) (vadose zone) (enter 100,000 if no biodegradation, 1000 for BTEX)
T1/2 (d) (groundwater zone) (enter 100,000 if no biodegradation, 1000 for BTEX)
Select Soil Type from drop down list

Φ (total porosity) (minimum GPL default = .25)
Pb (g/cm³) (dry bulk density) (minimum GPL default = 1.5)
foc (vadose zone) (minimum GPL default = .001)
foc (aquifer)
Dg^a (cm²/d) (gaseous diffusion coefficient) (7000 = default)
Dl^w (cm²/d) (liquid diffusion coefficient) (.7 = default)
d(diffusion layer thickness,cm) (.5 = default)
 θ (vol/vol)= moisture content (minimum GPL default = .15)
Jw (water flux- cm/d) (minimum GPL default = .007)
time step (days) vary until output graphs shows complete curve, Jury 1 solution)
L (cm)(depth of incorporation- Jury 1 solution)
Z -cm(depth to water, or depth of interest, Jury 1 solution)
depth profile time (d), Jury 2 solution)
total vadose zone depth (cm, Jury 2 solution)
Distance to compliance point (Sc) (meters) (minimum GPL default = 30)
Release width (w) (meters) (minimum GPL default = 10)
Well screen interval (s) (meters) (minimum GPL default = 8.2)
Water Quality Standard (ug/l)- see note regarding standard
Groundwater velocity (cm/d) (actual velocity not Darcy velocity) (minimum GPL default = 10)
Infiltration rate outside of source area (cm/d) (minimum GPL default = .007)

Model Inputs

Select chemical name from drop down list
Ct = Initial total soil contamination, ug/kg (ug/kg = (ug/l)/Pb)
Kh (dimensionless)
S (water solubility, mg/l)
Koc (L/Kg)
T1/2 (d) (vadose zone) (enter 100,000 if no biodegradation, 1000 for BTEX)
T1/2 (d) (groundwater zone) (enter 100,000 if no biodegradation, 1000 for BTEX)
Select Soil Type from drop down list

Φ (total porosity) (minimum GPL default = .25)
Pb (g/cm³) (dry bulk density) (minimum GPL default = 1.5)
foc (vadose zone) (minimum GPL default = .001)
foc (aquifer)
Dg^a (cm²/d) (gaseous diffusion coefficient) (7000 = default)
Dl^w (cm²/d) (liquid diffusion coefficient) (.7 = default)
d(diffusion layer thickness,cm) (.5 = default)
 θ (vol/vol)= moisture content (minimum GPL default = .15)
Jw (water flux- cm/d) (minimum GPL default = .007)
time step (days) vary until output graphs shows complete curve, Jury 1 solution)
L (cm)(depth of incorporation- Jury 1 solution)
Z -cm(depth to water, or depth of interest, Jury 1 solution)
depth profile time (d), Jury 2 solution)
total vadose zone depth (cm, Jury 2 solution)
Distance to compliance point (Sc) (meters) (minimum GPL default = 30)
Release width (w) (meters) (minimum GPL default = 10)
Well screen interval (s) (meters) (minimum GPL default = 8.2)
Water Quality Standard (ug/l)- see note regarding standard
Groundwater velocity (cm/d) (actual velocity not Darcy velocity) (minimum GPL default = 10)
Infiltration rate outside of source area (cm/d) (minimum GPL default = .007)

Appendix M
Southwest Gas Corporation Excavation
Guidelines

SOUTHWEST GAS CORPORATION

EXCAVATOR PRECAUTIONARY GUIDELINES

This information is to assist excavators in the proper identification of gas facilities, and precautions to be taken when working around gas facilities. The information provided here is not to be considered all-inclusive. All excavators digging within the vicinity of gas pipelines must protect the pipelines in accordance with the applicable One-Call law. The following are guidelines that will assist you in protecting the public, you, and the gas facilities.

If any gas pipelines are damaged, federal law requires that you call Southwest Gas Corporation (SWG). Additionally, if the damage results in the escape of gas, **you must call the Emergency Number 911.** *Note: Damage includes damage to steel pipeline coatings, gouges in plastic pipe, damaged tracer wire, dents or scrapes in steel pipe, etc.*

Gas pipeline markers are used to alert the public that gas pipelines are buried in the general area. These markers may or may not be placed directly over the gas facility. When performing an excavation within 10' of a "High Pressure" marked facility, please contact SWG to arrange for stand by personnel to be present.

PLASTIC PIPELINES: Polyvinyl Chloride (PVC) pipe is one type of plastic pipe used in the SWG gas distribution system. PVC may be faint yellow, gray or white in color and range in size from ½" to 2" in diameter. PVC is not as flexible as the polyethylene (PE) pipe that SWG installs today. The integrity of PVC can be compromised if scratched or subjected to external loads and/or stresses. PE is another type of plastic pipe used in SWG's system. PE may be found in various colors and range in size from ½" to 8" in diameter. Although PE is a more flexible material, its integrity can be compromised if scratched or nicked. Many plastic gas pipelines are installed with a tracer wire in order to locate the facility. If a tracer wire is or has been severed or damaged, call SWG. We will repair the damaged wire at no charge.

STEEL PIPELINES: Steel gas pipelines, used in both SWG gas distribution and high pressure transmission systems, range in size from ½" to 24" in diameter and are also susceptible to damage. Dents and gouges in the steel will affect the integrity of the pipe, so precautionary measures must be taken during excavation. Steel pipelines are protected with an approved coating material that helps prevent deterioration of the pipe and can be found in various colors. If during excavation the coating is torn or damaged, contact SWG immediately to facilitate the repairs at no charge. *Call us before disturbing any mastic coating on active or abandoned steel pipe. The coating is likely to contain regulated asbestos fibers that can be harmful to your employees.*

Typically, most gas pipes have specific identification markings on them or on the coating. Care should be taken to support and protect all gas pipelines, as required by law, when exposed or crossed during excavation activities. Additionally, care must be taken while exposing existing facilities as they may or may not have padding and shading surrounding them as outlined below. **If any gas pipeline is damaged, call SWG immediately to facilitate the proper pipeline repairs.** When excavations have been completed, gas pipelines must be properly padded, shaded, and backfilled per SWG standards, as shown in the drawing below. SWG specifications for padding and shading material call for it to be able to sift through a 3/8" screen, and be smooth and relatively rock free. Excavations must be compacted to meet the requirements of local authorities. During backfill activities it is very important to compact the soil beneath the gas pipe in order to properly support it. Also it is important to avoid mechanically compacting the soil directly over the gas pipe to eliminate any unnecessary external stresses. Steps must be taken during this process to protect the gas pipeline from excessive external loadings. If other utilities or substructures are to be installed in the same excavation as a gas pipeline, the proper clearances shown in the drawing must be maintained.

If at any time during excavation activities you smell gas, call SWG and 911.

- **DO NOT** attempt to control or stop the flow of natural gas, or make repairs.
- **DO NOT** turn on, turn off, or attempt to move or operate equipment near the line break or point of leakage.
- **DO NOT** enter the area where the natural gas is escaping.
- **DO NOT** allow others to enter the area.
- **DO NOT** leave the scene of the incident until assistance has arrived.
- **DO** secure the area and prevent others from entering.
- **DO** eliminate sources of ignition, such as sparks or flames, near the gaseous atmosphere.

For more information on the types of gas pipe used by SWG, positive identification of gas facilities, or if you have any questions, please contact the SWG office nearest you. Additional information on natural gas safety is included in our Material Safety Data Sheet (MSDS) located at www.swgas.com/emergencysafety.

SWG Contact Number: () .

Please forward to the appropriate excavator.

**SOUTHWEST GAS CORPORATION****STANDBY CHECKLIST**

Use this form whenever notification of a standby has been received to document that the appropriate safety information has been provided to the excavator.

Company Name:

Date:

One-Call Ticket #(s):

Review the following responsibilities with the excavator.

- ☐ Hand dig within 24-inches of SWG facilities. Vacuum excavation is acceptable. California excavators are required to get facility owner authorization when using vacuum excavation to pothole.
- ☐ Verify the One-Call ticket request is valid.
- ☐ Provide the Form 284.0 Gas Pipe Identification pamphlet. Provide Form 279.0 Excavator Precautionary Guidelines, and review with the excavator when PVC is present.

HIGH PRESSURE STANDBY

- ☐ Implement the standby when excavation is within 5-feet of high pressure facilities.
- ☐ Positively identify gas facilities prior to the excavation.
- ☐ Exposed facilities must be protected and supported.
- ☐ Avoid pulling excavation material towards the gas facility. Pull material away from the facility whenever possible.
- ☐ If the facility's coating is damaged, qualified personnel will follow the appropriate Corrosion Control Procedure.
- ☐ When the excavation has extended 5-feet from the facility, the standby may be concluded.

BORE STANDBY

- ☐ Implement the standby when boring across or parallel within 5-feet of gas facilities.
- ☐ Positively identify gas facilities prior to the bore operation.
- ☐ Inspect the boring operation while in progress until there is no longer a threat to the facility.

Boring Across Gas Facilities

- ☐ Prior to boring across within 24-inches, expose the full circumference of the facility (see procedure).
- ☐ Pothole must be deep enough to see the bore bit and reamer.
- ☐ Maintain a minimum of 12-inches of separation between the bore bit and reamer.
- ☐ Less than 12-inches of separation requires approval from Southwest Gas.
- ☐ Gas facilities deeper than the proposed bore path require an additional pothole of 24-inches to ensure adequate separation (see procedure).
- ☐ Measure distance between gas facility and bore bit and reamer to determine adequate separation.
- ☐ If bore bit has not reached predetermined distance, request the operation to stop to inspect gas facilities.
- ☐ Leave the inspection pothole open during bore crossings. Verify the bore crossing occurred as expected, or visually inspect SWG facilities during the boring operation to ensure that no damage occurs.
- ☐ Electronically measure depth of bore bit and reamer to ensure adequate separation before & after crossing.

Boring Parallel to Gas Facilities

- ☐ Request the excavator to perform inspection potholes of the gas facility at appropriate increments.
- ☐ Gas facilities deeper than the proposed bore path require an additional pothole of 12-inches to ensure adequate separation.
- ☐ Monitor the bore path to ensure adequate separation is maintained from SWG facilities.
- ☐ After the excavation has been extended 5-feet from the facility, the standby may be concluded.

RE: Manufactured Gas Plant (MGP) Remediation Wastes

Dear Ms. Lockwood:

This letter is in response to your inquiry letter of March 12, 2001, to the Arizona Department of Environmental Quality (ADEQ), regarding the State's adoption of the federal judgement concerning manufactured gas plant (MGP) remediation wastes.

Research of available literature and discussions with US EPA Region 9 with respect to MGP remediation wastes yield these findings;

1. In a case decided April 21, 2000 by the District of Columbia Court of Appeals, the requirement to use the TCLP for evaluating MGP waste was vacated.
2. Guidance from the US EPA point of view further clarifies this issue. MGP wastes are not subject to TCLP testing if the only hazardous characteristic is toxicity. Wastes that exhibit other characteristics or that are listed would still be required to be handled as RCRA wastes.

Provided a waste determination is completed for each site and the MGP wastes do not exhibit other hazardous waste characteristics or are not listed as specified in 40 CFR §261 Subpart C and D, ADEQ concurs with the conclusion that TCLP is not required for MGP remediation wastes.

If you have any questions regarding this letter, please contact me at (602) 207-4105.

Sincerely,

Laura Malone, Manager
Hazardous Waste Inspections and Compliance Unit

Subject: Manufactured Gas Plant (MGP) Remediation Wastes

Dear Ms. Malone:

Arizona Public Service Company (APS) has eight (8) MGP sites throughout Arizona. APS and its parent company, Pinnacle West Capital Corporation (PWCC), have been working through the Arizona Department of Environmental Quality's (ADEQ's) voluntary remediation program (VRP) to clean up five (5) of those sites. APS and PWCC recently completed, in Prescott, Arizona, what is expected to be their largest MGP remediation project, and the remaining sites are scheduled for remediation in the next few years.

At each of these MGP sites, there is the potential to encounter soils and/or tar-like material that tests hazardous for benzene and/or lead under the toxicity characteristic leaching procedure (TCLP). At the Prescott site, most of the soil generated that exceeded the TCLP limits was managed under the area of contamination (AOC) policy, as approved by ADEQ last year.¹ However, MGP wastes that exceeded the TCLP limits that could not be managed using the AOC policy were stored, transported, and disposed as hazardous waste.

In April of last year, the United States Court of Appeals for the District of Columbia Circuit vacated the use of the TCLP for the purpose of determining whether MGP wastes exhibit the characteristic of toxicity under the federal hazardous waste program. *See Association of Battery Recyclers, Inc. v. EPA*, 208 F.3d 1047 (D.C. Cir. April 21, 2000). Since MGP wastes are not listed under the federal program, MGP wastes are no longer considered hazardous under the federal program unless they exhibit the characteristics of ignitability, corrosivity, or reactivity.

¹ See letter dated March 16, 2000 from Alan Roesler, ADEQ, to Judy Heywood, PWCC, and ADEQ Interoffice Memorandum dated March 15, 2000 from Greg Workman, ADEQ, to Alan Roesler, ADEQ).

APS Energy Services and APS are subsidiaries of Pinnacle West Capital Corporation; however, APS Energy Services is not the same company as APS.
You do not have to be an APS Energy Services customer to receive quality regulated services from APS.

A.R.S. § 49-922.A. provides that ADEQ may not adopt standards that are more stringent than or that conflict with federal hazardous waste standards or identify wastes as hazardous that are not hazardous under the federal hazardous waste program. Because the TCLP may no longer be used to determine whether MGP wastes are hazardous under the federal program, and because ADEQ may not impose standards that are more stringent than or in conflict with the federal program, we believe that the TCLP is no longer applicable to MGP wastes in Arizona. Therefore, MGP wastes should not be considered hazardous wastes in Arizona unless they meet other state hazardous waste criteria. We request ADEQ's written concurrence.

From a practical perspective, APS and PWCC plan to continue to send any MGP wastes that exceed the TCLP to hazardous waste treatment, storage and/or disposal facilities. The treatment and disposal methods that APS and PWCC use for non-hazardous MGP wastes are not well suited to handle higher levels of contaminants, and we believe that TSDs are the safest and most appropriate facilities to manage any MGP wastes exceeding the TCLP limits. However, we do not anticipate labeling, manifesting, or reporting this material as hazardous waste. Of course, MGP wastes will still be subject to Arizona Special Waste requirements if they qualify as "petroleum contaminated soils."

We would be available to meet with you if you would like to discuss this issue further. If you have any questions, please contact me at (602) 250-3361.

Sincerely,

Barbara Davis Lockwood, P.E.

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY

WASHINGTON, D.C. 20460

NOV 13 2000

OFFICE OF
SOLID WASTE AND EMERGENCY
RESPONSE

MEMORANDUM

Subject: Implementation of Vacature of TCLP Use for Evaluating Manufactured Gas Plant (MGP) Wastes in the *Battery Recyclers* Case

From:  Elizabeth Cotsworth
Director, Office of Solid Waste

To: RCRA Senior Policy Advisors,
RCRA Waste Enforcement Program Managers
Regions I-X

This memo is to notify you that the D. C. Court of Appeals, ruling in the case: Association of Battery Recyclers, Inc. et al. v. U.S. Environmental Protection Agency (decided April 21, 2000), vacated the use of the Toxicity Characteristic Leaching Procedure (TCLP) for evaluating manufactured gas plant (MGP) wastes.

In the *Battery Recyclers* case, several aspects of the Agency's Phase IV Land Disposal Restrictions (LDR) final regulations (63 FR 28556, May 26, 1998) were challenged. Among the issues addressed in the Phase IV final regulation was the Agency's earlier court remand in *Edison Electric Institute v. EPA* 2 F.3d 438 (D.C. Circuit, 1993), regarding application of the TCLP to evaluating whether mineral processing and MGP wastes are hazardous wastes. In *Edison Electric*, the plaintiffs challenged application of TCLP to their waste on the argument that the waste is not managed in MSW landfills, as presumed by the TCLP mismanagement scenario. The court held that the information in the record at the time was insufficient to show a rational relationship between the TCLP and a likely mismanagement scenario for mineral processing wastes. The Court's remand required that the Agency provide some factual support that the TCLP mismanagement scenario is plausible for mineral processing and MGP waste. The Phase IV proposal and final rule responded to the Court's remand by providing the required factual support. In the *Battery Recyclers* case, the affected industries challenged the adequacy of EPA's response to the *Edison Electric* remand.

In ruling in the *Battery Recyclers* case, the court found that EPA produced insufficient evidence that MSW disposal of MGP waste has happened or is likely to happen. The Court concluded that "...the EPA has not justified its application of the TCLP to MGP waste" and consequently ruled to "...vacate the Phase IV rule insofar as it provides for the use of TCLP to determine whether MGP waste exhibits the characteristic of toxicity."

Recycled/Recyclable • Printed with Vegetable Oil Based Inks on Recycled Paper (Minimum 25% Postconsumer)

Since the court decision, we have received several inquiries concerning the implications of this decision for MGP cleanups. In a recent response to a letter from Vectren Corporation, an Indiana utility company owning a number of MGP sites, Michael Shapiro, Principal Deputy Assistant Administrator for Solid Waste and Emergency Response, provided EPA's view on this question. As the response states, under the Court's ruling, MGP waste cannot be classified as Toxicity Characteristic (TC) hazardous, since the TCLP test is part of the TC regulatory definition. Also, because MGP wastes are unlikely to exhibit any of the other hazardous characteristics, they are unlikely to be classified as hazardous under the federal program. As a practical matter, this means that individual MGP cleanups will probably not be regulated under federal RCRA Subtitle C.

For your information, I have attached a copy of Mr. Shapiro's letter to Vectren. Also, I call your attention to the preamble to the proposed Corrective Action Management Unit (CAMU) Rule, which makes the same point on the Battery Recycling decision and MGP wastes (See 65 FR 51087, footnote 6, August 22, 2000).

Of course, as you know, states may have regulations that are broader in scope than the federal regulations, and they may regulate MGP wastes as hazardous under their own state requirements. Also, many states regulate MGP cleanups under independent state cleanup programs, and state industrial waste requirements may also apply. Therefore, we are encouraging utilities and other parties conducting MGP cleanups to consult with the appropriate state regulatory authorities.

If Regional Office staff have any questions about TCLP or waste classification they may contact Greg Helms at 703-308-8845, or for questions on corrective action issues, Mike Fitzpatrick, at 703-308-8411.
